Block#10 Day1_2

Keynote Session Report: Internet Governance

Date: Sunday, March 3, 2024

Location: Tokyo

Duration: Approx. 90 minutes

Main Speakers: Dr. Shin’ichiro Matsuo, Joseph Beverley, Hirotaka Nakajima

Summary

- BGIN Co-Chair, Dr. Shin'ichiro Matsuo opens the meeting, emphasizing the importance of the Blockchain Governance Initiative Network (BEGIN) meeting and the inclusion of workshop sessions to create new documents. Speaker 1 also highlights the collaborative nature of the meeting and the focus on fostering open dialogue and community building. The significance of this being the 10th BEGIN meeting in Tokyo, where the initiative started, is mentioned, with a reflection on the progress and expansion of the network despite challenges such as the COVID-19 pandemic.

- The conversation continues with a focus on the evolution of BEGIN, including the development of documentation processes and the role of physical participation in enhancing community engagement. The goals for the 10th meeting are outlined, emphasizing the need for a sustainable and inclusive community that welcomes newcomers and younger generations. Dr. Shin'ichiro Matsuo calls for continued innovation and openness within the blockchain ecosystem, drawing parallels to the initiative's roots in internet governance.

- Joey Beverly recaps the previous BGIN meeting in Sydney, highlighting the progression of the initiative in terms of organization, participation, and the range of topics discussed. He notes the increasing complexity and depth of discussions, covering areas such as regulation, treasury management, and identity, and stresses the importance of continued engagement and development within the BGIN community.

- Hirotaka Nakajima discusses the lessons learned from internet governance, including the multi-stakeholder approach and the challenges of engaging with civil society. Nakajima emphasizes the importance of open discussion platforms and decision-making bodies in fostering collaboration and trust within the Internet and blockchain communities.

- The conversation delves into the challenges of maintaining an open and fragmentless internet, especially in the face of geopolitical tensions. The importance of preserving the

integrity of the Internet and the role of organizations like IANA and ICANN in managing Internet resources and standards is highlighted. He also touches on the need for a place to discuss emerging issues and the significance of rough consensus and running code in internet development.

- Discussion turns to the application of lessons from Internet governance to blockchain, addressing the importance of building trust, addressing security concerns, and establishing platforms for open discussion. The potential for creating a trusted group of experts within the blockchain community is considered, along with the challenges of decentralization and the need for clear governance and implementation strategies.

- The conversation continues around the theme of community development and sustainability, exploring ways to incentivize participation and engagement in blockchain governance. The challenges of balancing inclusivity with effective decision-making are discussed, with suggestions for improving communication and collaboration within the BGIN community.

- Discussion focuses on practical steps to enhance governance mechanisms within BGIN, such as creating a forum for requested comments and establishing a version control system for documenting evolving conversations. The importance of accommodating diverse participants, including those with restricted access to certain platforms, is emphasized.

- The session concludes with further exploration of ways to strengthen the BGIN community, including identifying key ecosystems within blockchain, fostering dialogue between diverse groups, and finding innovative solutions to governance challenges. The potential for creating a more accessible platform for community contributions and the importance of implementing practical governance solutions are highlighted.

Transcript:

01:59
Speaker 1
So I hope so the remote participant can hear us. Okay, good. So thank you for coming. This is a 10th general meeting of the Blockchain Governance Initiative network begin. And thank you for coming to Japan. This year. We are holding that event with Japan Fintech Week, and this is almost first event of that this week. Anyway, we changed that some modality of meeting by including workshop sessions to create a new documents. And so we have tons of great workshop sessions during these four days. So I hope that all of you, including remote participants, will participate to that coworking to create new documents. So based on the command understanding we will have throughout discussions, I would like to pass this microphone to the local organizer, Jimpe Mua. Okay, thank you, Mattu Sensei. Okay, so welcome tokyo. Good afternoon.

03:24

Speaker 1
There's some housekeeping issues for starting the block number ten here. So this room is restricted to the harbor kind of food and drink, but soft drinks is okay here, except for the networking after the event and the bathroom, the outside before starting the physical session of the broke number ten. So I have a little bit brief remarks on broke number ten. So my pleasure to be here with you to open the first day of the beginning broke number ten, as well as the day of the first day of the Jabba fintech week. And this time is, as you know, the 10th meeting of the beginning. So I extend my congratulations to the memorable meeting of the beginning in Tokyo. That is the place of the genesis broke of the beginning.

04:27
Speaker 1
So for the next couple of days, we will in depth discussion on the governance of the digital and crypto assets and digital identity and applications based on the blockchain technologies. Applications will extend the financial, non financial items that addressed from DeFi, CBDC, stablecoins and the world security design, and to the identity world coin, the security impact of MVC and the JKP, et cetera, today for a memorable, tense meeting here. So I'd like to review the last couple of years since the launch of the beginning. I remember the initial stage of the beginning in the September of the year 2020. The beginning was established following the G 22,019 communique under the Japan's presidency. Its goal is to provide an open, neutral platform for dialogue and diverse stakeholders and blockchain community.

05:28
Speaker 1
The march stakeholder discussion body aims for the proper documentation of the underlying agenda under and coding by the multistakeholder participation and the proper community governance. Begin is expected to play a similar role in the blockchain ecosystem as the organization like IETF, ICANN and IGF that are down for the Internet governance. The network aims to be deepened common understanding, address issues and promote sustainable development within the blockchain system. Remember the amid the age of the copied from the 2020 to 2022 begin. Even though beginning has been expanding the network hosted by the diverse brace that strikes regional and stakeholder balance using the remote participation even in the hard situation, it was the first time to allow us full physical participation along with the remote participation in the Zurich, Switzerland at block number six in 2022.

06:34
Speaker 1
After that, the documentation process and workshop style discussion corrected by the March poor efforts of the participant has become a norm for us. It has taken a great step and the revamp of the physical participation contributes to extending the community capacity. Now we can reach the tense event begins role is gradually coordinated, but we are still underway and we should define it for the next Thames meeting. Using this opportunity. I want the Brook number ten to be an opportunity for designing the future role sustainable community as well as cultural mindset for more engagement. We will be more inclusive and we'll be building more engagement for newcomers and the younger generation to sustain the community.

07:27
Speaker 1
Lastly, please keep in mind better safety, assuming the case of the possible earthquake, because as we often face it, but for the next couple of days, I truly hope to make a successful and productive week. Thank you very much. Okay. Thank you very much. So we would like to start the first session, and this is opening session. This is an 80 minutes session. And to discuss about that our goal of block number ten cell and the beginning sale and how we organize that four days event. Firstly, so I would like to ask Joy to provide the recap of the previous meeting because we think that the chain of books are very important. So we would like to start with that recap of the previous meeting in Sydney. Then we asked Hirotakanakajima to provide a talk about that multistakeholder discussion.

08:45
Speaker 1
For the global technology is very important then. So we have 40 of 50 minutes discussion. So what is the goal of block number ten cell anyway? So I'll pass the microphone to Joey for the recap of the previous block. Hi, everyone, my name is Joey Beverly. I'm from solvis and singularity net. I was the previous block nine local chair in Sydney,

Australia. I'm happy to say this is my fourth block meeting. The first meeting, I think Mitchell and I decided for me to go within what I think it was 24 hours. So we saw it made sense, booked the tickets and I was there. And so experiencing block seven, block eight. And now running block nine and being a block ten, there is a significant progression we've made. So as obviously we append new blocks to this chain that we're making.

09:36
Speaker 1
We're also kind of reflecting back how much we've completed, done and how much we've changed over this period of time. So in block seven, if those who were there, I think we had an, a four piece of paper at the downstairs area where were going to be meeting that said block seven this way in a little direction. And now we have screens, now we have banners, now we have labeling the discussions and speakers. We have a working website that can list all the programs. We have Google calendars now. So we're rapidly progressing as a think tank, but rapidly progressing how? We organize, run, conversation, people that attend, people who are willing to travel across the world. We're willing to break the times, break it by 1020 hours at a time. Thank you. Thank you.

10:20
Speaker 1
It's only impossible that around six organization coordination, preparation from preparing and adding extra day, generally both generally, meetings happen every time, two to three times usually last around three days. But when we started to realize that the name blockchain Governance Initiative network never had a day. We had a day on industry, we had a day on IP, but we never had a day. We never, as blockchain governance initiative, another day. That's how we add usually half day on Sunday. This allows us to these kind of more difficult to find answer, but equally important to have conversations went through half the first day was half day on governance regulation. How do you actually discuss policy regulation? How do you actually discuss the issues that happen with blockchain regulation? It's been very interesting to see how quickly it's passed. Equally, there's a massive focus on talent.

11:44
Speaker 1
There is pressure on producing these requirements. But in blockchain we've had problems with regulators in Australia. We've had people who've helped regulators to be pursued by regulators thereafter. And so again, discussing judgments. How do you actually work together? And I'm cleaning day two.

12:05
Speaker 2
Thank you.

12:08
Speaker 1
And I'm doing centralized treasure. One of our first conversations was a conversation I've never seen, I never thought would possible at any other conference. We had someone who worked on the CBC in Australia. We had a regulator, radio policy advisor. We had someone who issued stablecoins.

12:26
Speaker 2
And.

12:27
Speaker 1
Working on a decentralized all discussing primary versus secondary issuance. It's a conversation I never thought would ever be possible with people from a central bank or assisting a central bank all the way through to a decentralized stablecoin provider. It just would pass me. But this is what blockchain governance initiative network does. There's neutral grounds, we can have discussions and more or less as the day progressed on, went deeper into more financial applications, although we got to miss from Fabian, which is meant to be the primary keynote. We did go into privacy pools and dark pools from the team in Australia. And following from that on day three went to identity, obviously reputation, I went into attestations. And then finally on day four we heard from a shrine industry.

13:13
Speaker 1
And obviously I'll give that basic recap because I want everyone to go on the discourse and look through the discourse for all the kind of key pieces as well. But as well, we are very rapidly progressing as an organization, discussions, the people, where we're going to, what we're doing and only onward from now. So that's all for me. But thank you so much for invitation and equally for running this and can't wait to see what the next few days look like. So thank you. So, before going to the next battle, so is there any question on the recap what we discussed at only last year, of course, that we discuss about what we discussed at last time. Anyway, thank you very much. Joy. And then next, so I like to introduce, he has a long history of the contribution to the Internet, to governance.

14:12
Speaker 1
And so Asan told that the original idea of the beginning is so we should learn from the Internet of the effort and the history of the Internet development. By using that multi stakeholder discussion. He is engaged in his long history of work, that he was engaged in the main work for the IETF, IGF or any other kind of things. He will give a talk and what is the success of the Internet development things or what is the problem? So what we should learn from the Internet history? Anyway, I would like to pass this microphone to Hirotaka to provide a talk.

15:01
Speaker 2
Thanks so much, Matzo sensei, for the introduction. Okay, so thanks everyone for coming today and having this opportunity to talk about residence, learned from Internet governance, what went well and what didn't. So today I would like to discuss how we can apply these lessons to blockchain governance. So, my name is Hirota Kanaka, working at US based finance institutions as a site reliability engineer. So before going to the main topic, let me explain my relationship with Internet and blockchain, I started my Internet community career as the engineer at Worldwide WCC, the Worldwide Web consortium where the web standards such as HTML are standardized. After working at WCC, I served at Internet society in Japan, something we call just isok a Japan chapter as an officer to organize the Internet community to enhance the Internet usage or how we bring Internet to everyone.

16:21
Speaker 2
The first touch point to blockchain is CGTF. I think that many a couple of people attending from CCTF to begin as well. CDTF is a japanese community of security experts to discuss the security best practices of crypto assets. I think that we will have another speaker from CCTF during the beginning broke number ten I think day three I guess I was also working with the Internet draft shown the screen or ISO tiers 23576 at ISOT 307 which is Mattosa, one of the author. I was also working in addition to those activities, I'm also working as an network engineer to learn on s network where it's kind of like individual network on the Internet.

17:19
Speaker 2
So please remember that the reason I cannot say my affirmation properly, but this topic discussed today are my opinions not only and do not reflect the view of my current or former employer. So let's start. So first of all let me explain the most important. Unlike rules of the Internet that we reject kings, presidents and voting, we believe, but we believe in love, consensus and running code. You may be heard this sentence, but this was originally proposed during the ITF 24th meeting. I think it's 1992 and ITF which stands for Internet Engineering task force. I think everyone already know that is praised to discuss the technical issues of the Internet. Nowadays there are many Internet related organization, but ITF was only the praise to discuss in the early stage of the Internet. So we discussed.

18:23
Speaker 2
Actually I haven't participated in 24th meeting because I was too young, too small. But anyhow people discussed the issues and technical issues and also like political or sometimes policy issues and operational issues on the ITF. So this slide is originally explaining the decision making process of the ITF in comparison with the OSI which isO standards. So they compare the ISO standards and the ITF way to discuss what the pros cons of their decision

making processes. ISO is marginal organizations where every country is participating has one voting light. So that's the reason we said kind of voting on that. We reject the voting because of that. So finally, as you know, the Internet community chose the slower way which on the screen and to make making decision or lose, but prefers open processes.

19:27
Speaker 2
And in my opinion this is one of the core value of the Internet today. So how the Internet is governed today, the critical issue of the Internet is following three topics. The first, resource management second, standards. Third, operational practices. Let me explain briefly explain what one by one. So resource management, everyone using the Internet using IP addresses, domain names. So we need to some price to discuss who use or how we use those IP addresses. The domain names and protocol parameters is the kind of parameters used in protocol. The one example is like if we use HTTP, usually use a port, TCP port 80 and such stuff. So if someone proposed protocols and hey, I'm going to use port 80 and no, the HTTP already reserved a port 80, so you should use another port number. Such kind of stuff.

20:34
Speaker 2
The second standard, it's needless to say, are the protocols such as IP, TCP, HTTP, and thirdly, operational practices. That's norms and deployments. So the one example is manners, mutually agreed norms of net routing securities, which is like how when we operate the network as networks, and there is a rules like we should obey for providing safer and secure network on the Internet and the deployment. So as the network grows, there is many issues, so we need to deploy new protocols to fix the issue. And deployment is a kind of a key to the Internet. So in my opinion, those three is a critical part of the Internet topic of the Internet. So now I directly explain the only authority of the Internet, ayana, the Internet assigned numbers authority. So that's only one authority of the Internet.

21:43
Speaker 2
Interestingly, Ayanna is not some kind of organization, but just a function. So there is no INA corporation or INA organization type of stuff, every stage of the Internet. So everyone needs the IP address to connect each other. And so there is someone or somebody needs to manage that, who can use that IP address to allocate assigned IP addresses to each network. So the Ayana, it started as the research project or University of South California. But unique point is that IaNA does not have decision making function. So if I crane, okay, I want to use eight. Eight, but it's already used by Google, but I want that number because it's very easy to remember. So there's a dispute. But Ayanna does not have the functionality for resolving such kind of issues.

22:47
Speaker 2
So Ayanna just follows the recommendations or requests from other Internet standard bodies, such as IETF or ICANN. Another interesting point. So since I said Ianat is just a function and it's not the organization, so the administrative body of the Ayanna is traditions for many times. So at the beginning of the Internet, it was just a research project of University of Southern California. But as Internet grows, many people asking for many assignment or requests, so it's the gladiator funded by NSF. But as we know, as everyone knows, Internet is not someone's Internet is everyone's Internet. So there is some tension that why US government has a funding to iana function because it's critical functionality to the Internet and why US government has some kind of influencing power to that functionality.

23:56
Speaker 2
To address that issue, the Internet community such as global top rebel domains are people in the GTLD and discussed and proposed the idea like okay let's make something to support iana functionality with global coordinations. But the US government still wants to keep that stewardship of the INO functions. So they responded with the idea so which we called white paper. So let me explain. So during that white paper, I think it's published in early ninety s. I guess so on the white paper, US government said okay, US government will lease the power to control INR functionality. But okay, we please build like let's build establish a new company, new organization to

manage the ICAnn functionality. And on their statement it says like board of directory of new corporations should be equal equitably and blah blah.

25:14
Speaker 2
And also it's interesting that Internet users should be included that board of directors. And also interestingly official government or intergovernmental organizations should not serve on the board. So it said okay, so you guys, Internet community can control INR functionality by yourself, but you must include user community but not include the government. That's a very interesting point. As you see on the figure on right side, you see the Red Square and it's ALAC, it's like atlage advisory committee, which means it's an Internet users committee. So they have a special committee especially for open to Internet users. And that committee had one seat for Icanbold and also they have five seats to the nomination committee. So they have strong influence power to the ICANN governor. So that's a very interesting point.

26:21
Speaker 2
And that's the reason why we call multi stakeholder and every time we say we should include the user is the reason why is that this is the reason why we need to engage users and user communities. I explained ICANN. So ICANN is kind of like government merge organization approach to having the to have ino functionality. But still there is some discussion. Some countries shows interest to govern the Internet by March rattle not march stakeholder model. There is a reason that still we migrate to the ICANN, we establish ICANN, but still us government have the stewardship of the IANA functionality. So that's the reason why some countries, no, still the Internet is US government under US government. And there is some such issue. The Internet governance forum was funded. The Internet governance forum is actually chartered by UN, but functionality is very limited.

27:58
Speaker 2
It's just discuss issues around the Internet. And also, it's very interestingly, IGF does not have a decision making mandate. So people can come to the ITF and do some discussion, but there's no functionality to make statement or having a mandate. IGF is just come and talk. That's it. This is very interesting, because it seems like IGF is governed established by Un. So it's kind of very powerful power. It looks very powerful, but actually it doesn't. People just talk and that's it. And also, interestingly, the team or session of IGF are determined by large stakeholder group. So if even the host country, the last year IGF 2023 is hosted by japanese government, but japanese government is just host country, so they don't have the power to select the pick up the sessions or provide a team.

29:09
Speaker 2
And also those sessions are expected to reflect diverse perspective. So if anyone propose the IGF session, those sessions must be meets the multi stakeholder approach. So if I submit the, for example, if I submitted like session about, okay, let's talk about blockchain governance, but participant, like five panelists over the five or four panelists from Japan, and five or four panelists is just industrial, I think that such kind of session will not be accepted. So we should have diverse the participant even on the panelist and include regional diverse and also stakeholder gender. We should include many perspective on that. And there's many meter like regional IGF are held all around the world. So for example, like APAC, we have AP IGF and it's hosted in Asia Pacific country every next. So I just revisit what the IGF and I can such kind of Internet organization.

30:29
Speaker 2
Let's move on to do some postmortem. What went well. So, first of all, we agreed to maintain the fragmentless Internet. Let me give you the example. In 2022, Washi invaded in Ukraine, and there is a discussion that we should disconnect Washi from the Internet to protect from misinformations, et cetera. However, Lip is like european authority, european organization to manage the IP addresses. So everyone in the european area, they need to send application to ripe to. Hey, I want to need these IP addresses and ripe and ICANN refused a request to shut down russian Internet because of renewable results in losing the flea and open access to the Internet. So every time we have this kind of discussion, every time we do not have split Internet. So Internet is just one. We don't want next Internet number two, or Internet special Internet for some territory.

31:36
Speaker 2
So Internet should be just one. And people think that Internet should not be used as geoportical issue, that geoportical weapon. So that's the reason. So as a result, like G, seven countries committed to issuing the exemption for the sanctation for telecommunications services. So the people in Russia could still have the access to the Internet. In my opinion this is very unique to the Internet. Comparing to the here financial industries, Asian bank were removed from Swift. So that's very unique. Second, we managed to have a press to discuss many ish topics which are sometimes not directly related to the Internet among the various stakeholders.

32:26
Speaker 2
For example, I think in around 2013 there is an incident by NSA US government like everyone knows Snowden issue and during that time technical community has and many Internet community strongly disagree that kind of movement because it's completely opposite for the open free Internet. But still we have that praise to discuss. So we don't like shutting down the communication. So sometimes the relationship with regulator is not the best, but we try to communicate to the stakeholder counterpart. So that's the reason why I still have an open free Internet now. So I think that's what went well part. So let's move on to what we learned part. So at the beginning of my speech I explained the fundamental loops of the Internet community. So that it's like we reject king or any types of party authority as we like syncs moves very slow.

33:38
Speaker 2
It's very difficult if there is no king. One of the example is IPB six migration. IPB six is standardized protocol in ITF in early 2000 to address IPV four shortage. So if IPP four addresses running out like new network cannot be joined. So the IPP six is a countermeasure. We expected the migration will be completed around 2010. But as you see the chart, it's still far from the completion. Another issue is CBO society engagement. Most of the early stage Internet are tech people. So it was very difficult to engage non technical people like we call civil society to the discussion. I could list the reasons, but one of the reasons is we bit inclusive. We are bit inclusive as typically those people, including me, is considered nerd. So there are some barrier the distance with normal people. That's maybe a reason.

34:45
Speaker 2
Of course there are many other reasons to we failed in the civil society engagement, but in my opinion we should keep trying to engage civil society. But I think it takes more time. And third, love consensus was not perfect. So I said life consensus, like we reject king, but we choose consensus. In ITF, ham is used to make love consensus, not by raising hand or voting. So for example, chair said if you favor the option a, please hand and if you prefer option b. And so chair compares how loud each options. Generally it works, but sometimes we fail. We fail several times. So one of the famous example is mandatory codec for HTML video. Nowadays if you go to the YouTube or whatever, wherever, you don't need the flash, it flashes already disappeared so that we have the HTML video.

35:53
Speaker 2
So on, the HTML video needs kind of mandatory codec. So all the browsers should implement this codec like type of stuff. And there are two options, age 22 64, which mainly supported by Apple and another one is the PP eight which mainly supported by Google. And we failed which consensus with discussion. So we bought it by humming, but I was there but both hammers so loud as discussion is like, as we notice, like okay, we need to have. So there's many people jump into the room and help the hamming and we failed as a result. Hmobile video was shipped without mandatory codec, which resulted in slower adoption. So overall, in my opinion, those attempts internet community works well, but there was some lessons we learned from that. So let's move on to the blockchain.

36:54
Speaker 2
I believe the blockchain and the decentralized finance will be one of the core infrastructure for future society. However, there are many things we need to address. First of all, I think everyone you know that there are many issues we have to buy the ICO and NFT. To be honest, this is the reason why I'm interested to blockchain and crypto

set as a technology, but not a big fan of them. Second, we still have so many security incidents. I could understand the security is a key of the project or custodians. Therefore they don't want to open the details because of the business reasons. However, in contrast, like online criminals are working together and exchange information, but we are blocked by compliance legal business rules to enhance the security by exchanging information.

37:47
Speaker 2
So there's the second reason, the third that this is related to previous one, but we don't have a price to discuss. I think that we have session day three to discuss about incident response or like it type of stuff so we can discuss more details at the session. So now I directed some lessons from the Internet. So first, the march stakeholders approach is so painful, it's so slow. So every stage of the Internet is okay, hey, I need a new TLD. Okay, we're going to open up new TLD, but I think we already had this same discussion the previous meeting, but still we are doing because all voice should be heard. So if we make something, we need to ask for opinions, questions and for each stakeholders. So the example is in a function transition.

38:49
Speaker 2
So like a US government finally gives up all the power to ino functionality. And at the time I can ask for opinions for each community. And they said, I forgot the year, but June 1 is end of May is a kind of deadline. But some community failed that in a transition is the most important topic for Internet governance. But they failed because they need to ask for opinions or listen their voices opinions for all the stakeholders. That takes time. And also the next point is can regulator gave up existing marginal approaches. So I think many of the crypto asset industries dealing with fat of travel laws, but regulator already have martial approach to discuss like fault of travel laws, but it's not acceptable in my opinion. It is not acceptable.

39:57
Speaker 2
Regulator is like sometimes regulator, if regulator decides some regulation, okay, let's do the march ratio. But they say, oh, we need a new innovation, let's do the March stakeholder. So that's not acceptable sometime. So maybe we should for regulator. I think we need to think about this. If you think March stakeholder is worth trying that we might some sort of give up existing marginal approaches. Second is the place to have an open discussion is important. Like Igfish. So like stakeholders, I think I don't need to list, but like chains, traditional finance industries, government, tech communities, academia and civil society. So as I said on the Internet governance approach, civil engagement, engaging civil society is so hard. And I think we have in begin, we have like a large stakeholder approach, but we very small number of people attending from the civil society today.

41:03
Speaker 2
So I think there still have a room to engage with the civil society and how open. It's another important point. So Internet community, sometimes people doing bad stuff internet, but the Internet community is tried to be open. For example, Tor is like there is privacy sealed network browsing system for the Internet. So if you're using Tor, technically you can hide your identity from anyone. But of course some people doing using Tor for good use. But to be honest, 99% of usage is kind of criminal. But Tor project, for example, like Tor project applying the new TLD, like TR, onion and the community accept that proposal. So like onion is reserved in IANA functions in a TLD top level domain list.

42:19
Speaker 2
So sometimes we need like, yeah, Tor is used in some criminal usage, but Tor is also used in used for free speech, such kind of stuff. So, okay, yeah, I know Tor is not criminals are using, but we should protect the free Internet. Free Internet. So that's another stuff. Let's move on. Number three is a place to make decisions, also important. I think that this is very challenging in my opinion, because blockchain is not like, it's not same as Internet. So there is no one blockchain type of stuff. So blockchain is like each blockchain community has each rules and each policy, each governance. So it's very difficult to bring all the blockchain contributor in the same place and discuss some thing. But I think we can start from common interest. Building trust from the society is. I think it's one common topic.

43:27
Speaker 2
Because if some blockchain project fails and people lost some trust for entire blockchain or crypto asset or defy any type of stuff, it's going to be a huge risk for all the community. So maybe those type of stuff might better to discuss. And those are controversial topics like privacy versus traceability is kind of very controversial. And there is no answer but the discussed like IGF ish praise. We can discuss making the itfish praise to making some document or the discussion might be helpful. And also rap confessors is like, as I said, it failed, but most of the case it works, so it might be helpful. And finally, landing code culture is important as well. So many of us is contributing to the begin documents or other Itfiso documents.

44:27
Speaker 2
But most important point is even we write some documents, but no one use that document or standards, it's just a waste of time. So it's very important if we bring some new ideas, a new document, it should be like implementing somewhere. If we set a policy, that policy should be implemented in some government or some area. I think that's also a very important point, because we are kind of contributing to the human society. So if we spend time to the human, our society, I think it should be used in some way. The reason to all the Internet is also important. So maybe with Internet I come from Internet war. So maybe we are going to be deprecated with web three. We are going to be repressed by web three kind of a style.

45:29
Speaker 2
But NFD domains such as is not like NFD domains like cranes, uncramed top level domains. So as I said, onion is craned, it's reserved, but ETH is not reserved. So I don't know if some time, some company talked to ICANn. Okay, hey, I want to use AceR and NFD, the Ethereum project, still using the Acer. What's going to be, it's going to be a clash, it's like conflict. So maybe it's better to have some reason to classical Internet is important. So finally, please don't forget that where the blockchain decentralized finance are deployed. So if you think the Internet is transparent, it's a common and it's an Internet ubiquitous, so you can use anywhere. But if you please consider what is under area of the blockchain, I think that's a very important point. Finally, lessons from Internet.

46:39
Speaker 2
So trusted experts group might be useful on the Internet. We have Internet architecture board IAB. That board is like publish a document of the letter to the regulators or policymakers. For example, when we had NSA incident, IAB published a document generally to the government and this is not good something like. Or sometimes they also publish a document to the community. So for example, response to the NSA's issue that they discuss and the encryption everywhere, like design, encryption by design is kind of better way. We shouldn't move such kind of stuff and that they publish a document. And also sometimes it's such kind of for blockchain, I think sometimes that kind of group might publish a document of, for example, these technologies used in this way, but we might not be able should not use that kind of stuff.

47:54
Speaker 2
Of course, in blockchain we don't like some kind of authority. I really understand. But if we have some common interest to protect to building up, maybe we can have such kind of technical experts as an individual contribution might be interesting. So thanks for your attention. And that's the end of my speech and I think it's open up the queue for the discussion, whatever questions or comments or complaints and I pass the mic to thank you very much.

48:33
Speaker 1
So before moving to that open discussion, so you might have that many questions about that speak.

48:44
Speaker 2
Thank you. That was a fantastic presentation, really appreciate it. I'm curious your thoughts with this using the

ICann and IETF and IGF models I think really make a lot of sense for the infrastructure when you think about its use in similar ways as the Internet for information transfer and application builds, et cetera. But when you view it through the lens of financial infrastructure, like you pointed out for Fatif, this is where I think that the tensions for regulators and thinking about broader governance for underlying financial infrastructure and in a way that may not have the reach and oversight of regulators in the same way. What are your thoughts about balancing infrastructure that works for both financial purposes and information purposes? Can we make distinctions on when it's Internet activity and be governed one way versus when it's financial activity?

49:39
Speaker 2
It meets some of these other multilateral expectations. What are your thoughts? Thanks so much for questions. And that is very good questions. And to be honest, I don't have the answer, but do you think Internet is kind of. Internet is also studied as kind of similar situation. So when Internet was established and Internet is completely enemy of telecommunication industries. So that's kind of similar for financial and telecommunication is governed by the ISO, the ITU, such kind of March Ratle way. And gradually the Internet is doing another approach, but they gradually working together and having liaison kind of stuff. So if I answer your questions, controversial stuff like regulations might not be good start point to discuss because many people should be involved and it's going to be very slower. But I think most important point is communicate each other with the parties.

50:57
Speaker 2
So march stakeholder with the get involved, all the party on the same floor to discuss is one of the start point. Sorry I couldn't answer your question.

51:14
Speaker 1
Question. First off, thank you so much, that was amazing. I've learned so much about obviously iitf just then, and really trying to put in context to what begin could do too. So the question is begin related and equally your knowledge from ITF. We've had issues when it comes to attrition. There's times where being here for the last two years, we've had groups with 2030 participants. Sometimes it goes down to seven participants, sometimes there's a case where we have more people having notetaker bots inside of the meeting than actually people in the meeting. So we have this issue where we have these amazing discussions at these events, but then as soon as we kind of finish the event, they kind of dissipates. We don't have people contribute to documents, the conversations becomes harder.

51:53
Speaker 1
How do you manage that and balance the incentives to incentivize people to attend, to participate in ongoing regular discussions, and equally to fall that onto more tangible written based actions and as you said, like to code to implement. What can we do to apply this knowledge now? How do you manage those incentives for all the stakeholders?

52:13
Speaker 2
Thanks so much for question. In my opinion, in ITF, people writing the documents, but most of their document contribution is individual contribution. So if everyone like this document, they publish the name and with their affiliation, but technically this document is like the affiliation is not, they don't count into the affiliation. So this is purely individual contribution. If I talk to people in the ETF and Internet governance area, people just love Internet and they discuss how we're going to improve the Internet in many ways. So of course, if people publish RFC, maybe they can get PhD because of the RFC. But generally speaking, just people doing, contributing a good. So of course, and also people working in large enterprise, people are coming to attend ITF to promote their technology, like embedded their technology into the Internet standards.

53:31
Speaker 2
So there is many way that they got incentive. But generally speaking, like ITF activity or IGF, people just coming, just attending there to have Internet more better place. So for blockchain, I think it's very difficult because we don't

need one's authority. So for ITF we need the one authority. That's the reason why people come to the ITF, then discuss. But blockchain it is not. But as I said during my talk, that trust from the community, like society, all society, global society, is the one issue that we should address and that is the critical part of the blockchain community. So maybe that's a start point. From that, let's talk to each major blockchain project. Of course, also that project is kind of decentralized, so there is no leader type of stuff. But that's a start point.

54:38
Speaker 1
So just repeat that back. It's making it more convenient for people to access and to participate without the need to dedicate and commit. The second piece is to be more specific about where we are and what we're kind of solving for within blockchain, because most likely we won't be needing to have the general authority because obviously decentralized technology requires decentralized governance and equally organization. And the third and final piece was primarily about, I might have missed that third piece. Was it on that with how we incentivize organization or how we the trust, sorry, with trusted, being trusted parties and then to break that. So maybe for Shinichira that's something we can look at about how we can attack those three areas for begin, that's off me. Maybe to build upon that a little bit. But anyways, thank you very much.

55:32
Speaker 1
Brilliant presentation, I really enjoyed it. And I've got gazillion questions. Maybe later on we can debate those. But to build on this, so there are naturally differences between the Internet and the blockchain as it stands now. And blockchain is very fragmented, including the platforms to debate and discuss. Begin is probably a small fish in the pond. There are much bigger organizations like World Economic Forum. To begin with, they debate blockchain. So being that fragmented, if it were you to build blockchain, Ayana Internet, jet governance or something, how would you approach that?

56:18
Speaker 2
Thanks so much for your comment questions. And the one way is having the good conversation of the controversial topic, for example, like privacy and traceability, we cannot bring some answers. So if you have a pure privacy blockchain project, but with some traceability, it's not possible. But I think every blockchain project, people discuss same agenda, same topic in each blockchain project. So my proposal, why are we just having same discussion in the one place? Because if we have more participant and more point of view, maybe we can blink new ideas or of course there is no answer for pure privacy coin with traceability, but we can build up such kind of discussion. And during that discussion, I think there is some trust between each other. Of course the viewpoint and opinions is not they cannot agree each other, but they can have some trust.

57:26
Speaker 2
I can talk to that guy and maybe we are different point of view. That's start point, I guess it's kind of like academic conference style, because that's my point.

57:39
Speaker 1
That topic specifically is interesting because last year at begin at specifically decentralized treasury working group, we had such conversations. We had zcash present, dash talking about the technology. I don't recall. There were some regulators perhaps, but they were stablecoin issuers as well. That did not result really anywhere. I don't know whether it's our fault we did not really massage this properly and did not produce any outputs, or whether nobody else was interested.

58:17
Speaker 2
Yeah, so that's a good question. Of course, it's very difficult to reach the conclusion because of the topic, but important thing, in my opinion, is having the conversation each other and building a trust. So if we cannot agree in some point, but if we might can agree in this other point, but if we don't have composition each other, there is no way to having some kind of trust. So of course it's very difficult to leach consensus on some type of topic, especially

with legislator and project. But on IGF, there is also every time on the IGF, same every time IGF in the discussion, there is many people claim that, for example, western based country has many Internet assets, and why we don't get the Internet assets in other countries like type of stuff. And there is no answer for that kind of stuff.

59:28
Speaker 2
But we keep talking each other, and sometimes we can work together, but sometimes we failed. So at least we need someplace like everyone can attend and say something. That's my opinion, and sorry I couldn't answer your question.

59:48
Speaker 1
Thank you.

59:51
Speaker 2
A fantastic point and great discussion. One example, and I'm wondering if you think that this is something that we could evolve to, or if this might speak to why this one standards effort was really successful or was successful after we passed the FATF standard for the travel rule, after we passed the virtual asset standards at the FaTif, the crypto industry had been engaging a lot at the Fatif. I was part of the Finsun delegation there for the US. And then industry came together and created an effort focused one technical standard, the IVMS 101 standard, which stood for intervasp messaging standard. So basically they were adopting the ISO standard for swift messages but into crypto, and then they passed the first ever, as far as I knew, industry driven standard for something that at least had been deliberately articulated as a regulatory expectation.

01:00:49
Speaker 2
Of course, you've talked about the challenges with regulators and with this, but I wonder if you feel that maybe something to hit on this issue of adding specific value to demonstrate that value to why specifically these groups need to participate here to focus on something kind of discreet and determinable in that context might be helpful. I just wanted to throw it out there for consideration. But I very much agree with your point on there needing to be someone to set the table for people to come together. It's very interesting that people working in blockchain prefer ISO. There's many ISO standards, but ISO is not decentralized. It's centralized, it's not decentralized. So maybe we can, since we have many regulators, many government participation, why don't we have such kind of standard here? Of course there's many way we should do.

01:01:46
Speaker 2
But yeah, that's another big point. Thanks so much Kumar.

01:01:49
Speaker 1
I know actually we're nearly at time we need to switch over, but I just want to say one last point so we can run with practical applications for how begin can participate and obviously again be implementing practical applications. We had an idea from one of the previous papers and was a solbound governance token ERC. So we could potentially put efforts towards making our first EIP ERC to represent begin about a governance token that is semi fungible, solebound based, that could be implemented by a range of decentralized organizations and that could be one of our first initiatives that leads to something that is applicable and uses all the research we have made and created from San anti treasury IKP and equally these governance conversations. So I'll put that to begin. Members and members who are participating at block ten about that idea. Thank you.

01:02:54
Speaker 1
Thank you for the presentation. I have a question on the community development and community sustainability of discussion. So as I mentioned in the short remarks on the first. So I want to know the ITF development of the

community building or more inclusiveness of discussion. So what is the main motivation for the inclusion or some kind of the means for expanding such kind of community building. So do you have any thought on this?

01:03:36
Speaker 2
Thanks so much for your question. So ITF, first of all, ITF is a technical community, so ITF is a press to discuss protocols standards. So the people attending the gigs are attending. So the ITF, the people coming to attending the ITF, just their interest in that technologies. But ITF, there is many other organizations for the Internet. So ISOC, Internet society is the kind of administrative body of. And ISOC is the mission of ISOC is like bringing Internet to everyone. So ISOC is trying to leech the civil society or industries all around the world. So then they encourage people to participate that discussion. And of course ITF is not a place to discuss. Then ISOK holds some community events to lift up their issues. And also like ITF and Ikin, of course they have a large alac we call atlage.

01:04:44
Speaker 2
Atlage is a press to discuss any issues among the Internet. So to be honest, at large in Japan is very suspended status. But in some region, for example, us has very good activity on atlantic community. Many people, many students or many civil societies get involved in at large. So for the Internet there is many, several organizations get involved in the engage the community engagement. ITF is just the four technical perspective. And also like ITF, every time ITF we have the day first onboarding session for a new joiner or having more engage more students, computer science students to get involved in the ITF, such kind of stuff.

01:05:47
Speaker 1
ITF is making the kind of atmosphere to be inclusive for the newcomer and the students, for example, they are making the tutorial sessions or something. I think there's challenges for begins as well, because we are open platform, but sometimes we don't need to organize syndication to make specific consensus on this. But the contrary is that we have to strike the balance between the kind of some specific decision making process and open discussion. So this is the current our challenges, especially in the beginning. But I would like to make discussion more in the future about the balance or inclusiveness of the newcomers or something. Thank you.

01:06:51
Speaker 2
In terms of fee, IGF is completely free. Admission to IGF is free, but admission to ITF is that people needs to pay. So that's kind of like, it's also a unique, interesting point, because IGF should be open to the public, so it should be open. So if people said I cannot attend IGF because of he, that should be avoided. That's the reason IGF is free. But ITF, it's like motivation is very clear. So I have the idea, I want to make that idea to be standardized. So, okay. You need to come to that place. You need to pay some pay. So that's kind of like even the beginning. We have this open discussion type of thing, and also having that documentation, like making this decision making part. So maybe we can split that part into two part. And that's just an idea.

01:07:48
Speaker 1
The other question, but we have 20 minutes more for the discussion. Okay, so I think you suggested one of the example, privacy and traceability, as in one example, we can probably start working on discussion, but we literally have the privacy versus discoverability session right after this. And yeah, that will be moderated by Carol. I think it is a really good opportunity for us to make it a trial. I don't want to say it is a trial, because I know that you spent a lot of time on preparation of this session. But I think having a common understanding of what is the purpose of this begin and having a lot of people with different background engaged in this discussion, I think it's really important and I think, I hope we can do such sessions for the next four days.

01:09:13
Speaker 1
It's not a question, but I just want to talk about it.

01:09:17

Speaker 2
Thanks so much for a comment. And I think if we manage to engage severe society, which means a user, I think it's being going to be very strong because I think there is no kind of user community, general user community of. So it's if we can engage CBCI to listen their opinions or issues or concerns. And that's very good point, because I think, in my opinion, regulator wants to listen what citizens are concerned and thinking. So if this is a phrase, we can talk to both users, civil society and industries, that's going to be very powerful, because everyone can talk each other at all the concerns and maybe we can find a solution.

01:10:13
Speaker 1
Yes, I agree with you that both participating civil society and governments will add value. The question then how we can achieve that. And specifically, bitcoiners started as against central banks and against governments. So putting them in one room might lead to some unexpected consequences. And I'm curious, first of all, why don't we have, and we had some bitcoiners, I mean, bitcoin community representatives. I'm not quite sure whether anybody is present here now, but then again, they're not active if there are. And also likewise governments. I don't recall anybody from an acting government official participating in begin sessions, except maybe some local conferences in Europe. Don't remember anybody. So why are they not interested? I mean, that's rhetoric question a bit open. But if we don't do that maybe we'll have limited success. A comment to that.

01:11:21
Speaker 1
I think the question before that is what is begin trying to solve? What kind of governance are we looking to solve right now? Because is it going to be governance for regulation? We're creating the governance standards for how blockchain and the technology can interact with sound and safe and fair regulation? Or is it going to be about how decentralized organizations and the codification of their governance structures and mechanisms? Or is it going to be about how any DAP, any smart contract. So I think that maybe as a community and members and participants for this week to consider what is begin looking to solve for, because then we can start to identify what motivations, as you said very clearly, the motivations to participate, join and be inclusive within ITF was extremely clear.

01:12:04
Speaker 1
So therefore was very straightforward for anyone to participate equally, spend free time on that. I think that we need to do the same. We need to map out what our motivations are as a community and a governance structure. Who are other stakeholders looking to attack to? And equally, what's the outcome do we want and how does that affect them? Because. Exactly. Maybe the bitcoin is, aren't even part of the conversation because it's not very relevant. Because they're happy with 50 or so core developers doing something and then equally coming back to it a year later and go to Miami. I think we're supposed to have that strategizing session. Is it today, Sinchira, or when begin, like future governance begin self governance? Is it today or tomorrow? This is the one. This is then this is the right place to talk about it.

01:12:55
Speaker 1
Actually, I was holding on that question a little bit, because what we're trying to build is an ecosystem. I mean, that will be my definition. Yes, ecosystem of participants, stakeholders who want and have interest in blockchain or defi, et cetera. And ecosystem will succeed if participants, they are motivated to join and stay. And again, there was MIT research done some years ago that only one in seven ecosystems succeed after five years, majority 85%, they fail and split apart. They don't survive. And if we want to build that ecosystem, the glue and the kids success is actually like aligning motivation and interests. But then we probably should know who stakeholders are and maybe we don't or don't enough. And also what governance they want. Because governance, technical government standards are just publications. And again, that's an open question.

01:14:06
Speaker 1
I've got my views, but I'll let you talk and answer that.

01:14:14

Speaker 2
Thanks for comment. As you mentioned, I popped up the idea just one idea, but having clear what stakeholder you belongs in the beginning, I think everyone knows which stakeholder group you're in, but that's one point. But of course. Thanks for commenting. Governance, it means very difficult, many meanings. So on chain governance, like off chain governance, also like how we govern this community. If you're talking about governance, it's like there is many meanings, so maybe we can split it into the many parts and talking about what we want to discuss. And every community specifically have their discussion area to press discuss. So people can talk about particular on chain governance for a particular project, they can talk in their space.

01:15:21
Speaker 2
But here is more like general off chain governance, or general how we govern, how we establish or maintain, make it sustainable for this bigging community. That's a topic we might discuss.

01:15:45
Speaker 1
I think one of the first things we can do, practically even just today, is within discourse. We open a whole new thread, which can be like I was thinking about what kind of request a comment we can call it, but it could just be request a comment. And then we can start to do a standard about what template we can use so people can create an idea. So for instance, there might be a request, a comment of what definition of governance are we using? And then someone will write the motivation, the purposes, even application, if it's possible to go forward. That generally how we have done this over the last few years is we had like a basic website that was very simple, very straightforward, and then we had a very simple newsletter system.

01:16:24
Speaker 1
They have to type in your email and a password to continue to get. And now we have a working website that everyone can access. We have things displayed on that, but that came through a bit of more of an arbitrary governance system. Where was one person posed, three or four people were present, those people voted. That's not really a sound governance systems if the people who are voting are equally changing, unknown, or equally forced into the situation of having to vote. So maybe what we do straight away is within the discourse, is that we open a whole new thread which is just going to be called request a comment or just RFC, and then we just start a template around what a general RFC would look like, make an example of that. And then we start to post these ideas.

01:17:04
Speaker 1
Because I think verbally it's one thing, the next thing is then putting it somewhere, creating memory, and then, as they requested, comments, that person then accountable to the actions and outcome of that as an idea. Is there anything else like that, like requested comments and governance mechanisms that would be helpful and simple enough to implement? We'll begin that you've seen work.

01:17:29
Speaker 2
Yeah, definitely agree.

01:17:32
Speaker 1
But is there anything else besides request for comments to manage governance mechanisms and proposals or even something that I haven't mentioned.

01:17:47
Speaker 2
On the ITF? So ITF is a very broad activity for Internet technologies. But ITF, every time people polls the RFC and that Internet draft internetraft is labeled under the working group and then the working group decide okay, we're going to make it standardized. But we have many reviews we call not IAB area director. There is people working as

overview the area. And finally there is IAB is like the expert group and expert group makes some comments on the proposals.

01:18:37
Speaker 2
So if we can involve the core developer, core engineer, major blockchain project and let's say for example, if I propose a VIP and I can make the pull request on the bitcoin GitHub, but at the same time if I bring that VIP to this board and if I got the review from other core developer, okay, you are mentioning about blockchain, a bitcoin, but in terms of ethereum point of view, I think this is good. Oh hey, we have the same stuff in other blockchain and we did this way, so maybe you can apply that blah blah. And if we have this kind of praise to discuss, maybe better we can leverage that praise. And also people working for the Internet, people served internet architecture, they're kind of legend hero type of stuff. So it's very honor to be that on the board.

01:19:44
Speaker 2
Of course, blockchain is not that it's decentralized and we don't like kind of like authority type of stuff, but it's like for their personal career, it's very good to be the board member like one of the board for the architecture board kind of stuff. So if we have this kind of stuff in begin and we can get like, hey, if you write VIP, why don't have review on this board as well? Like that.

01:20:12
Speaker 1
So as another action that we can take is begin is we can start to look at how we can create these fellowships. Because I think maybe a fellowship might be easier than a board because trying to find, let's say ten different people that can talk on central banking might be easier because we have access to Masaki and Bank of Canada, potentially even the Fed. But maybe for, let's say on chain governance we may not have such a wide variety. So maybe we have a fellowship of key experts that can be multifunctional or cross functional. Sorry. And then we just make applications or we make invitations for those people.

01:20:47
Speaker 1
So then we can have those discussions because you shouldn't really need to attend every IKP or every decentralized treasury working group meeting, but let's say we are looking for requests of comment that we can't pose it to that group, and then we can get some kind of level of consensus from that group as another action we can take in today. I think I've hugged the mic too much. Any questions from any other ideas from the current members about what they've been thinking about what we could do to improve the governance features and mechanisms within begin to ensure that we have inclusivity and participation? Errol, I can see you thinking one of the ideas, I think it was discussed but not implemented yet, and maybe the salmon token might help.

01:21:31
Speaker 1
There is actually having some sort of mechanism to know who is well acting, doing what, and yes, be it voting, although you said voting is not good, or make it other rough consensus, but remote via tokens, rough token consensus if you wish, but something of that sort to make sure that we capture interest, motivations and decisions. Because sometimes it seems like we act like in a blind way guessing and that definitely has to be improved. Sorry, very new to this group, but following from the first idea, which is the forum thread, beginning of the conversation, and the second idea, which is later on the token system, maybe in the middle, just having a simple version control system for these conversations to be documented as they evolve. And I think the group has a GitHub like git space as well.

01:22:41
Speaker 1
So if you wedge that in the middle, you get a little bit more clarity on how it's evolving. Yeah, that's a great suggestion. My question was around what tends to be the crossover between the IGF participants and all of those other members of the board of ten. Is there almost like implied or compulsory participation by each of these groups at IGF so that the conversation is diverse and there's dialogue between these, and then the follow up to that question

is all of the organizations in the ICAM board, are they all sort of, you have to pay to participate, or is there a diversity of access there?

01:23:34
Speaker 2
Thanks for comment. So to question your question, the last question is participation. ICAN, ICN is a membership organization. So if you participate ICANN as a member, of course you need to pay the fee. But some stakeholders, for example, community, they don't need to pay. And for example, the government, they have a government advisory group as well, and government advisory group doesn't, they have the liaison on the ICANN. Bold. So if the government advisory board committee is consist of many countries government officials, and so they can attend they are participating I can with type of stuff and IGF and ICANN is technically completely separated. But Icann, of course there are people from Icann. Of course ASo is addressing number like wipe or apnic, who controls IP addresses. Of course they are participating IGF with their affirmation. Sorry, I missed your first part of the question.

01:24:56
Speaker 1
Sorry, no. So you did answer that. I guess what I'm taking from this is that perhaps in begin what we could do is identify, because the blockchain ecosystem is fragmented, we could potentially identify which of these ecosystems make up what could be considered the ICANN board, and then almost discover within the begin network who would be good delegations or liaisons to participate in these. And that could have two effects. One, our ideas and our concepts can be heard in these IGF style conversations. And secondly, we could also increase our participation and begin once we have delegations at different groups.

01:25:41
Speaker 1
I think we've discussed something like that before in block nine, but I'd just like to bring that up again, that these sort of association organizations could be something that we focus on moving forward and maybe to build upon that as well in one of your slides. Or maybe you just added that seeing some ideas implemented is powerful, right? If I remember right, well, yeah, no, just to implement, not simply to talk and produce documents, but also to see them implemented is important anyways. Yeah, I think it's somewhere there. Anyways, what I wanted to say is that prediction documents is good, but prediction documents about real life situations is definitely better and much more powerful, even like to communicate something that deliver the message to a community.

01:26:54
Speaker 1
So what I'm saying is that if any of participants today have any practical ideas, how these ideas, well, ideas about ideas being implemented, let's bring them up and talk, discuss, because we definitely have a lot of knowledge in the room and maybe together we can come up with some suggestions, recommendations, or even implementations ideas. And then if we document those, that message will be ten times impossible. I just wanted to answer your comments about the budget control systems, and I completely agree with that. But at the same time, we actually tried that beforehand. A lot of government officials actually had problems with the version control systems and that's why we had to move away from trying to, we are trying to use git actually in the beginning, but now we are using Google Doc.

01:28:09
Speaker 1
So it's a kind of skill problem as well as I guess some of the agencies do have access control issues to their repository as well. Yeah, do you mind if I double click on that? What was the nature of the issues out of curiosity, a couple of reasons. I at least recognized two issues. One was skill issue, obviously. The other was the access issues from the office. Sometimes the access to GitHub, for example, is being shut down. Yeah.

01:28:56
Speaker 2
So for ITF we have for Internet draft of same thing. So we have many special tools to compose draft, Internet draft, and sometimes even the like. Access is, of course, nowadays, now the ITF is praised to difficult Internet standards.

So if someone says, I cannot access to ITF from my company, and then we're going to say, no, that's your fault. Software is fixes, but I think this is very early stage. So, yeah, might be.

01:29:28
Speaker 1
We need another one question to anyone who's had issue with the git login to pass and maybe to Hal. Have you had any issues with logging into discourse? Have you tried to log into discourse? And was there any issues? Yeah, personally I don't have any issues for accessing the discourse, but I think it's difficult to access from the inside office of the government agency, even digital agency. But maybe I can ask to open that network as a personal access from there. We need to get the permission to such kind of rules because of the security reason. Absolutely. So maybe if there's a way we can do requested comments without having to log in, maybe it could be a whole new page on the website where people can submit a requested comment and then it's populated within discourse to manage the thread itself.

01:30:54
Speaker 1
So then we can have a fact that if you're a government official or let's say you can't log in at all, it's kind of a broken system. If you can't log in, therefore you can't make a request, therefore we can't ever know. Maybe we make a way to have a publicly available request, a comment, and populate it back into discourse. It's an open source system. Sorry, we use discourse, which is an open source radical exchange. They're using quadratic equations to manage proposals and voting. But that's what we implemented as well. So we can potentially find a way with open source program and fork that and further develop out a big and related one. I think one thing we could try to implement to tackle this issue is maybe lean a little bit more on the working group sort of biweekly meeting.

01:31:50
Speaker 1
And that working group biweekly meeting can upload the information that was discussed to discourse to build that memory and therefore also accommodate for people who can make comments in the working group meeting, but may not be able to access the discourse and write it down. Okay, and thank you very much. And it's time to close this session, unfortunately. So we have the time for the networking after the two sessions of today, and we have that another session on day four to discuss about our roadmap. Let us continue this discussion. Thank you, madam, everyone, for the discussion. Thank you. Okay, so, yeah, let's make a transition to the next session, and please come here. So if you are the main discussant and I don't know how many chairs are needed, no, Gemini is not. She's removed.
