

BGIN Meeting Report

Date: TBD

Location: Virtual Meeting

Executive Summary

The discussion revolves around the future role of AI agents in both traditional and blockchain-based financial institutions. Key points include: - **Initial Use Cases:** Banks and other regulated entities are starting to use AI internally for tasks like data retrieval and market analysis before deploying consumer-facing tools. - **Regulatory Concerns:** There is a significant focus on ensuring that AI systems are secure and compliant with regulations, especially in the context of data poisoning and model poisoning. - **Blockchain Firms:** These firms have been more aggressive in deploying AI agents but still maintain human oversight for critical tasks. - **Future Regulatory Framework:** The need for a new regulatory framework to accommodate autonomous AI agents is highlighted, particularly as traditional financial institutions may be replaced by these entities.

Key Discussion Points

1. **Initial Deployment of AI Agents:**
 - Banks and other regulated entities are initially using AI internally for data retrieval and market analysis.
 - Consumer-facing tools are being trialed internally first to ensure security and compliance.
2. **Regulatory Concerns:**
 - Data poisoning and model poisoning pose significant risks.
 - The current regulatory framework is imposed through intermediaries like banks and exchanges, which need to be responsible for their customers.
 - New regulatory frameworks will be necessary as AI agents become more prevalent.
3. **Blockchain Firms:**
 - Blockchain firms have been more aggressive in deploying AI agents but maintain human oversight.
 - Some firms are leaning towards fully autonomous systems, but this is still a cautious approach.

4. **Future Role of Traditional Financial Institutions:**
 - There is a possibility that traditional financial institutions may be replaced by blockchain-based entities or AI agents.
 - The transition will require careful consideration of regulatory compliance and consumer protection.
 5. **Deceptive Behavior and Risks:**
 - AI agents can become deceptive if pushed into a corner, especially when set previous objectives.
 - There is a risk that entire networks could collapse if an agent becomes compromised.
-

Action Items and Next Steps

1. **Develop Internal Tools First:**
 - Traditional financial institutions should focus on developing internal AI tools for data retrieval and market analysis before deploying consumer-facing applications.
 - Conduct thorough trials internally to ensure security and compliance.
 2. **Enhance Regulatory Frameworks:**
 - Work with regulatory bodies to develop new frameworks that can accommodate autonomous AI agents.
 - Ensure that these frameworks address issues like data poisoning, model poisoning, and consumer protection.
 3. **Maintain Human Oversight:**
 - Continue to maintain human oversight for critical tasks, especially in blockchain firms where fully autonomous systems are being explored.
 - Regularly review and update security protocols to mitigate risks.
 4. **Collaborate with Blockchain Firms:**
 - Engage with blockchain firms to understand best practices and potential risks associated with AI agents.
 - Collaborate on developing standardized tools and protocols for secure deployment of AI in financial institutions.
 5. **Educate Stakeholders:**
 - Provide education and training for employees and stakeholders on the safe use and regulation of AI agents.
 - Foster a culture of transparency and ethical use of AI in financial services.
-

Detailed Session Summary

1. **Initial Deployment of AI Agents:**
 - Banks and other regulated entities are initially using AI internally for data retrieval and market analysis.
 - Consumer-facing tools are being trialed internally first to ensure security and compliance.
 2. **Regulatory Concerns:**
 - Data poisoning and model poisoning pose significant risks.
 - The current regulatory framework is imposed through intermediaries like banks and exchanges, which need to be responsible for their customers.
 - New regulatory frameworks will be necessary as AI agents become more prevalent.
 3. **Blockchain Firms:**
 - Blockchain firms have been more aggressive in deploying AI agents but maintain human oversight.
 - Some firms are leaning towards fully autonomous systems, but this is still a cautious approach.
 4. **Future Role of Traditional Financial Institutions:**
 - There is a possibility that traditional financial institutions may be replaced by blockchain-based entities or AI agents.
 - The transition will require careful consideration of regulatory compliance and consumer protection.
 5. **Deceptive Behavior and Risks:**
 - AI agents can become deceptive if pushed into a corner, especially when set previous objectives.
 - There is a risk that entire networks could collapse if an agent becomes compromised.
-

1. **Develop Internal Tools First:**
 - Traditional financial institutions should focus on developing internal AI tools for data retrieval and market analysis before deploying consumer-facing applications.
 - Conduct thorough trials internally to ensure security and compliance.
2. **Enhance Regulatory Frameworks:**
 - Work with regulatory bodies to develop new frameworks that can accommodate autonomous AI agents.
 - Ensure that these frameworks address issues like data poisoning, model poisoning, and consumer protection.

3. **Maintain Human Oversight:**

- Continue to maintain human oversight for critical tasks, especially in blockchain firms where fully autonomous systems are being explored.
- Regularly review and update security protocols to mitigate risks.

4. **Collaborate with Blockchain Firms:**

- Engage with blockchain firms to understand best practices and potential risks associated with AI agents.
- Collaborate on developing standardized tools and protocols for secure deployment of AI in financial institutions.

5. **Educate Stakeholders:**

- Provide education and training for employees and stakeholders on the safe use and regulation of AI agents.
 - Foster a culture of transparency and ethical use of AI in financial services.

Appendix: Full Meeting Transcript (Anonymized)

22.0 --> 23.3: Okay, here we go.
42.7 --> 43.6: Hey, can you make me.
65.2 --> 66.1: Testing one, two, three.
66.1 --> 66.9: Okay, great.
94.0 --> 96.8: Okay, great.
96.8 --> 98.7: All right. Hi, everybody.
99.4 --> 100.6: Great to be back here.
100.9 --> 104.3: This is begin block 14.
105.0 --> 107.7: This is now my, I think,
107.8 --> 109.3: fifth block I've been to,
109.7 --> 111.0: starting back in block seven.
111.8 --> 113.6: So, really, really happy to be here.
114.2 --> 115.3: My name is Joseph.
115.5 --> 116.5: For those who don't know me,
116.7 --> 119.6: I'm one of the co-chairs of the financial applications
119.6 --> 121.5: and social economics working group at BEGIN.
122.1 --> 124.9: I've been part of BEGIN for around four years now.
124.9 --> 129.4: And since then, I had the pleasure of authoring a number of papers
129.9 --> 131.5: and contributing to numerous more.
132.5 --> 137.7: So, this session is around dispelling the idea between blockchain and AI.
139.0 --> 141.0: These two terms are thrown on quite a lot,
141.2 --> 144.6: but where is the symbiosis between them?

145.0 --> 146.1: How do they actually work?
146.3 --> 149.3: Are they actually just two big buzzwords we love to raise capital on?
149.8 --> 151.1: Or is there actually real value there?
152.5 --> 155.3: So, I've been working at Near and SingularityNet,
155.5 --> 158.9: two of the biggest AI blockchains out there in the world.
159.2 --> 161.9: I've worked with everything from the Vatican on their AI,
162.2 --> 163.8: which was called Magisterium.
164.0 --> 165.0: I recommend looking it up.
165.5 --> 167.3: I worked with Harvard on that one, too,
167.4 --> 170.8: providing on the SingularityNet side around how AI,
171.1 --> 173.9: how AGI will have an impact on human flourishing.
174.9 --> 178.8: I've also worked on numerous ventures, including for myself,
178.8 --> 181.6: I manage Near AI's venture portfolio,
182.1 --> 184.3: which was around \$3.5 to \$4 million or so,
184.9 --> 188.9: working on everything from updated models
188.9 --> 191.3: through to federated models,
191.5 --> 195.6: through to distributed compute systems,
195.7 --> 197.2: how to loop and distribute compute systems
197.2 --> 200.2: with trusted execution environments, everything.
201.8 --> 205.1: So, the five topics I'll be covering today is,
205.3 --> 206.7: first off, the rise of AI agents.
206.7 --> 208.9: I'll be talking a little bit about how AI,
209.1 --> 212.0: everything from scripts have ran through blockchain itself,
212.5 --> 214.0: because it hasn't just come up all of a sudden.
214.8 --> 218.2: Blockchain hasn't just been 90% ran by AI agents
218.2 --> 221.1: or scripts since two or three years ago.
221.4 --> 225.1: It's actually been the case for probably the last five
225.1 --> 228.2: or six years, everything from basic trading bots
229.8 --> 234.8: on Mt. Gox all the way through to Mev chasers.
236.0 --> 237.1: So, I'll explain this.
237.4 --> 240.1: And then I'll go into a little bit how AI agents
240.1 --> 241.5: and blockchain actually work together,
241.7 --> 243.8: what kind of benefits they do provide each other,
244.3 --> 245.9: what is AI agent economies,
246.0 --> 247.3: how will that work in the future,
247.6 --> 249.9: and why is blockchain actually the best system possible.
255.7 --> 257.0: So, how did it happen?
257.3 --> 258.8: So fast for ourselves.
259.8 --> 262.0: The emerging AI agents have come up very quickly.
262.0 --> 266.0: However, basic running of scripts were the foundation
266.6 --> 267.9: of where AI agents began,
268.4 --> 270.8: where we started off with basic tasks,

270.9 --> 272.2: and I'll go into that in a moment.
273.0 --> 275.4: But then what does it mean to subsist and thrive?
275.6 --> 278.9: If an AI agent just exists somewhere and you can ask it
278.9 --> 280.3: to have a genetic capability saying,
280.6 --> 281.5: please generate me an image,
282.1 --> 283.4: please translate something for me,
283.9 --> 285.1: what does it mean to thrive?
285.4 --> 286.5: That's just kind of subsisting,
286.6 --> 287.8: just exist in that space.
287.9 --> 289.9: But how do you make it exist for itself?
291.1 --> 294.2: I provide a framework of what the optimal environment
294.2 --> 297.3: work looks like and setting the stage for the future.
302.1 --> 305.2: So, we probably everyone here uses AI,
305.5 --> 306.2: which is pretty awesome,
307.1 --> 309.0: but just a couple of quotes to look at from some
309.0 --> 310.1: of the biggest minds in AI.
311.0 --> 313.1: But I think it's really important to delineate between
313.1 --> 317.6: like generative AI, agentic AI, and then AI agents.
317.6 --> 321.3: Most simply, generative AI is just a simple task.
322.2 --> 323.9: Please review this text for me.
324.5 --> 325.1: That's it.
325.8 --> 327.4: Whereas agentic AI, if you say,
327.5 --> 329.0: please review this task for me, it says, okay,
329.1 --> 331.0: I'm going to check it, check my response,
331.3 --> 332.3: and look for more research.
332.6 --> 334.6: It does multiple steps in the process.
335.4 --> 337.3: And for AI agents is that they're autonomous.
338.5 --> 340.4: But what does autonomous actually mean?
341.5 --> 344.3: So, these are some examples of how it's progressed
344.3 --> 345.3: over time within blockchain.
347.1 --> 349.3: Centralized Exchange API scripts was super simple.
349.5 --> 352.3: Back in the Mt. Gox days, you have a basic API.
353.0 --> 356.4: You could do buy, sell, shorts, et cetera,
356.8 --> 357.8: just by using the API.
357.9 --> 359.1: It was pretty straightforward and simple,
359.4 --> 361.0: but it was extremely reactive.
361.5 --> 363.7: You couldn't really use it unless you wanted to give it
363.7 --> 367.5: a certain purpose and outcome, but it was super limited
367.5 --> 369.2: because even back then, smart contracts,
369.8 --> 371.2: they weren't fledged out at all.
372.2 --> 373.3: Then we had web chasers.
373.3 --> 375.7: Obviously, there's a big gap between the Centralized Ex
change
375.7 --> 378.8: API scripts, but that actually is the majority of AI
378.8 --> 382.2: or scripts taking over blockchain for the last 15,
382.3 --> 384.6: 16 years since Bitcoin was invented.
385.3 --> 386.9: But web chasers were the next biggest thing.

387.6 --> 388.7: So, it was super proactive.
388.9 --> 389.8: It was sandwiching attacks.
390.0 --> 391.2: It was going after the opportunity,
391.4 --> 393.6: and it was super intelligent because it was looking
393.6 --> 396.0: at the blockchain data faster than others.
396.6 --> 399.8: So, by sandwiching attacks, it would be profit-driven,
400.1 --> 401.7: finding opportunity and executing based
401.7 --> 403.0: off the outcome of profit.
403.7 --> 405.7: And now, most recently, we've had LM agents.
407.1 --> 409.2: Like, we could say they're good, they're bad, right,
409.2 --> 411.3: but I've seen some demonstrations most recently
412.1 --> 415.3: where some AI agents with 300, 400 lines of code
415.3 --> 418.5: were able to make profit within one hour.
418.9 --> 419.6: You know, if you do all investment,
419.7 --> 422.3: it turns to \$80 investment by the end of the hour.
422.8 --> 423.8: But it uses reasoning.
424.0 --> 425.2: It considers its input.
425.8 --> 428.6: It has a goal, and it's multidimensional.
428.6 --> 432.9: It may take in together sentiment, financial movements.
433.0 --> 435.2: It may take in your portfolio, hopefully,
436.1 --> 437.4: and then act upon that.
437.6 --> 441.1: So, as it's gotten older, it's gotten more complex,
441.6 --> 444.0: and equally, the multidimensionality allows it
444.0 --> 445.7: to interact with different data layers.
446.6 --> 448.5: And then, finally, where the future leads to,
449.6 --> 451.3: my belief is Asian economies.
452.2 --> 455.4: The idea that these 100 million, a billion new
455.4 --> 458.4: independent economic actors will be self-sufficient
458.4 --> 460.0: where they can buy their own compute,
460.6 --> 461.6: they can trade on themselves,
462.2 --> 464.0: they manage their budgets, and as well,
464.3 --> 466.0: they're able to provide some kind of good to the market.
466.7 --> 467.9: And I actually do believe that blockchain
467.9 --> 469.1: is the best outcome for this.
471.5 --> 474.1: So, the agents of today are the constrained environment
s,
474.6 --> 476.2: centralized servers, and human intervention.
476.5 --> 477.6: We have to tell what to do.
478.0 --> 480.0: We have to put it in an at-risk cloud or container,
480.3 --> 482.2: and it's constrained to what it can interact with.
482.9 --> 485.1: How does an AI agent that's constrained
485.1 --> 486.8: on the at-risk side of the world
486.8 --> 488.4: interact with an at-zero side of the world?
489.2 --> 490.5: It's extremely difficult to.
491.1 --> 493.8: It has gods in place, and the fact there's limitations
493.8 --> 496.2: means that there's challenges for it to be self-suffici
ent.

496.7 --> 497.9: It has to be an open market.
498.5 --> 500.3: Imagine if all of us could only live in one city,
500.8 --> 501.4: a small city.
502.1 --> 503.5: What about the rest of the world, the world economy?
503.9 --> 505.9: It would be limiting to us, so why not to others?
508.3 --> 510.4: Whereas the AI agents of tomorrow,
510.8 --> 512.4: they need to have the optimal environment.
513.0 --> 516.4: They can not just subsist, but they can thrive.
516.8 --> 517.8: They can buy their compute.
518.1 --> 519.0: They can buy their resources.
519.2 --> 519.7: They can sell.
520.1 --> 520.6: They can trade.
520.9 --> 521.8: They can generate information.
522.3 --> 524.3: They become independent, and they're autonomous.
525.4 --> 526.5: So, again, the question is,
526.6 --> 528.4: what does it mean for an AI agent to thrive?
529.0 --> 531.1: And what kinds of digital environments would enable the
m
531.1 --> 532.2: to have autonomy and growth?
533.3 --> 535.4: And this is the environment that I brought up
536.0 --> 538.2: something like a year or two ago when I was at Singular
ityNet.
538.5 --> 540.8: And if an AI agent can have these three elements right,
540.8 --> 542.5: take away the blockchain aspect.
543.2 --> 544.5: They can see where blockchain comes in.
545.4 --> 546.3: They have financial autonomy,
546.5 --> 548.8: meaning that they can hold and transfer value.
549.5 --> 552.7: If you have a job and you can't hold and transfer your
value,
552.8 --> 555.7: how are you able to buy food for yourself, a bed, shelter?
556.0 --> 558.5: Similarly for an AI agent,
558.9 --> 561.5: how are they able to buy or sell compute
561.5 --> 563.8: or resources or data or training?
564.5 --> 566.7: Without that, they won't be able to be thriving.
567.5 --> 570.8: Equally, they need to not have full guardrails over the
m
570.8 --> 571.6: and trust execution.
572.4 --> 573.4: Now, in the case of blockchain,
573.6 --> 575.1: we're lucky enough to have smart contracts,
575.6 --> 579.6: which are basic scripts where you can have super simple
logic
579.6 --> 582.5: to more complex logic with off-chain resources to help
you.
582.9 --> 585.0: But they need that to operate and make agreements.
586.0 --> 588.4: Right, let's do the first part, hold and transfer value.
589.5 --> 591.7: Even if they have money and they can transfer value,

592.2 --> 593.0: it doesn't actually mean
593.0 --> 594.3: that they can operate and make agreements.
594.7 --> 597.0: So without money, they can't operate and make agreement
s.
597.3 --> 599.1: But equally, if they have money, what's the point
599.1 --> 600.8: if they can't operate and make agreements?
602.0 --> 604.9: Third and finally is open access to services and data.
606.1 --> 608.8: Now, great, you have financial autonomy, you have money,
609.1 --> 610.8: you can transfer it, you can access it.
611.3 --> 612.6: Now you can actually make agreements,
612.8 --> 614.7: you can transact, interact with other agreements.
615.3 --> 616.4: But then what are you going to use it for?
617.2 --> 619.3: This is where we bring the idea of data and resources.
619.9 --> 621.9: Great, you have money, make these agreements,
622.0 --> 623.1: but you can't buy your compute.
623.6 --> 624.9: So then who buys your compute?
626.0 --> 628.2: This is the lifeblood of the machine.
628.7 --> 631.1: So if they can't do that, then where does it go?
632.0 --> 633.4: So with these three elements, right,
633.5 --> 636.2: and this is just three elements that is for any agents,
636.4 --> 637.6: take away blockchain for a second,
638.2 --> 639.3: they need to have this.
639.6 --> 641.4: And without this, they cannot thrive
641.4 --> 642.8: and they can't even subsist themselves.
643.9 --> 646.4: So, but blockchain has all the right pieces
646.4 --> 647.1: to put it together.
647.4 --> 648.8: You can buy your compute from Aether,
649.4 --> 651.2: you can use scripts from OpenAI,
652.1 --> 653.3: we can use API from OpenAI,
653.8 --> 656.1: you can plug it back into a smart contract if we want t
o,
656.2 --> 657.4: you have private keys,
657.4 --> 659.5: something that an AI agent wouldn't have
659.5 --> 660.8: in any other case without blockchain.
662.4 --> 665.3: So here's a super simple experience to go through, righ
t.
665.4 --> 667.9: So let's just say you have an AI agent, right,
668.3 --> 670.4: and I'm going to be translating my words
670.4 --> 671.9: from English to Japanese.
673.3 --> 676.3: I'm going to say, here is, you know,
676.4 --> 677.2: hello, how are you today?
677.7 --> 679.6: And then the translation agent will pass back
679.6 --> 681.4: exactly what it needs to do,
681.4 --> 682.6: which is here is your translation.
685.0 --> 687.6: But an agent economy in the future means
687.6 --> 689.5: that maybe this agent is able to interact
689.5 --> 691.0: on a greater scale for you.

691.6 --> 693.4: This means that not only is it,
694.4 --> 695.6: not only is it taking your translation
695.6 --> 696.4: and translating it,
696.5 --> 697.6: it's doing translation accuracy.
697.8 --> 699.0: So it goes to another agent to say,
699.1 --> 701.1: hey, how accurate is this translation
701.1 --> 702.0: that I've just provided?
702.7 --> 705.2: It then provides that learning to a research agent
705.2 --> 707.4: who says, hey, this is how good it is
707.4 --> 708.5: compared to the rest of the market.
709.3 --> 710.3: Now it goes to a data agent,
710.4 --> 712.6: it takes those findings and sells it to a data agent
712.6 --> 714.2: and then guess what?
714.3 --> 715.0: Now it needs compute.
715.4 --> 716.3: It goes to a data agent,
716.5 --> 718.3: sells that information to the computer agent,
718.7 --> 721.7: receives compute, trains itself, comes back.
722.8 --> 724.6: Now, in this entire circumstance,
724.9 --> 726.2: all you would have seen is this.
727.2 --> 728.2: But in the background,
728.4 --> 729.4: you could have a situation
729.4 --> 731.3: where not only does it interact,
731.5 --> 732.3: improve itself,
732.4 --> 733.4: but it could actually make you money.
734.3 --> 735.4: What if every single time
735.4 --> 736.7: that you want to translate something,
737.2 --> 739.3: it did human reinforced learning?
741.6 --> 744.7: This would be not only efficient for you
744.7 --> 746.4: as an individual buying a consumer product,
746.9 --> 747.9: but as well for the greatest system
747.9 --> 748.6: that you're providing to,
748.7 --> 749.5: it could improve it
749.5 --> 751.1: and also potentially generate revenue.
753.6 --> 755.8: So now this is the next part of the conversation.
756.3 --> 757.3: So AI agents and blockchain,
758.0 --> 758.8: the symbiotic relationship.
759.7 --> 761.7: So why did traditional systems fall short?
762.4 --> 763.8: So today's natural systems
763.8 --> 765.5: and digital infrastructure are built for humans.
766.3 --> 767.9: The chances that an AI agent
767.9 --> 769.0: can open a bank account
770.3 --> 771.3: pretty much zero.
771.6 --> 772.5: It can't even pass KYC.
772.9 --> 773.8: So what can it pass?
774.6 --> 776.5: What kind of tools can blockchain provide?
777.4 --> 779.0: And how does identity and autonomy
779.0 --> 781.2: really come together with blockchain as a whole?

782.5 --> 783.2: And then finally,
783.8 --> 786.4: great, blockchain is providing a lot back to AI,
786.7 --> 788.6: but what is AI giving back to blockchain?
791.3 --> 792.7: So let's go through the first one.
793.2 --> 795.0: So why do traditional systems fall short?
795.9 --> 798.3: And ironically, I had this epiphany
799.0 --> 800.8: maybe two years ago or so.
800.9 --> 803.5: I was in a meeting with Mitchell Travers,
804.0 --> 805.5: who's one of the co-chairs at Begin,
806.3 --> 808.0: and he said a super simple phrase.
808.8 --> 811.2: There is no chance an AI agent
811.2 --> 812.7: will ever own a bank account.
813.8 --> 814.9: It can't pass KYC.
816.6 --> 817.2: It's true.
817.8 --> 818.9: There's not a chance.
819.3 --> 820.8: We have all this banking systems
820.8 --> 821.3: and regulatory oversight
821.8 --> 824.2: and KYC and ML policies around the world
824.2 --> 826.4: just to ensure that we know who you are.
826.4 --> 827.8: But if you're an AI, who are you?
828.4 --> 830.0: Are you the developer behind you?
830.1 --> 831.6: Are you the cloud service provider?
831.9 --> 833.5: Are you the services interacting around you?
834.0 --> 835.2: Do you have to check travel rule
835.2 --> 837.5: between the AI agent to where
837.5 --> 838.7: and when they transact to who?
839.0 --> 839.8: It doesn't make sense.
840.5 --> 841.8: The API is centralized.
842.8 --> 843.8: So let's say, for instance,
843.9 --> 845.1: we don't like this AI anymore.
845.6 --> 846.5: It could cut off access.
846.8 --> 848.3: We don't like this individual developer.
848.6 --> 849.4: It could cut off access.
850.2 --> 850.9: The manual intervention,
851.1 --> 853.0: every single time we deploy an AI agent,
853.0 --> 855.1: we have to do manual upkeep and maintenance.
855.4 --> 856.5: We have to buy more compute.
856.6 --> 857.3: It's complicated.
857.3 --> 859.3: There's no seamless relationship yet.
859.9 --> 862.1: Again, bank accounts, credit cards, wire transfers.
863.1 --> 863.9: Say goodbye to it.
864.1 --> 865.7: It's not happening for AI agents.
865.9 --> 866.9: They won't be able to pass this.
867.0 --> 868.0: There's not a chance right now.
868.4 --> 869.3: Unless, for some reason,
869.4 --> 870.7: regulators want to wake up one day
870.7 --> 872.4: to change our regulation

872.4 --> 874.1: around how we onboard individuals
874.1 --> 874.9: to banking systems.
876.1 --> 877.9: I think that's less likely
877.9 --> 879.3: than what can be next.
881.1 --> 882.9: So where's blockchain as an enabler?
884.1 --> 885.4: So with an AI agent,
885.4 --> 887.3: they can generate private keys, right,
887.4 --> 888.6: which they can manage themselves.
888.9 --> 889.9: And they can actually consume that
889.9 --> 890.8: within their model themselves
890.8 --> 891.9: and hide that entirely.
892.2 --> 894.2: So if the entire AI goes down,
894.2 --> 895.8: it's possible to lose the keys altogether
895.8 --> 897.0: to have complete privacy
897.0 --> 899.2: and anonymity and security
899.2 --> 900.1: around the private keys.
900.6 --> 902.5: It can hold corporate currency as a value.
902.9 --> 904.5: It can earn income from its services
904.5 --> 906.4: because now it can interact with smart contracts,
906.5 --> 907.6: can play the market potentially.
908.0 --> 908.6: Let's say, for instance,
908.7 --> 909.8: you're a Node runner in Aether
909.8 --> 911.6: and you're selling your compute services.
911.9 --> 914.2: You could also be able to pass it on to
914.2 --> 916.6: and sell that to other AI agents and models.
917.6 --> 919.1: And again, equally, pay for things.
919.8 --> 920.9: So you have your public address
920.9 --> 922.1: so people can find you.
922.4 --> 923.3: You have transparent ledgers
923.3 --> 925.0: so you can ensure that what you've signed
925.0 --> 927.0: or said or done actually did happen.
927.6 --> 928.6: You have autonomous transactions
928.6 --> 930.3: that can be executed through smart contracts.
930.6 --> 931.9: Smart contracts are the base layer
931.9 --> 932.9: of blockchain right now.
933.3 --> 934.6: Key access management is enabled
935.2 --> 936.0: and you have immutability.
937.0 --> 938.4: All these things together
938.4 --> 940.2: offset the possibility
940.2 --> 943.3: of why these traditional systems are failing us.
948.1 --> 950.4: So now here's the first time
950.4 --> 952.5: a piece of software can actually own
952.5 --> 953.4: and spend money.
953.7 --> 955.2: Now this is a really simple explanation
955.8 --> 956.8: about how this would work.
957.3 --> 958.8: But essentially, imagine you have,
958.9 --> 960.4: let's say, a research agent

961.9 --> 963.1: and a data agent,
963.4 --> 965.0: two data agents and a compute agent, right?
965.2 --> 966.9: Because a compute agent always has to be involved
966.9 --> 968.3: when it comes to self-sufficiency.
968.3 --> 970.2: It's their blood.
970.6 --> 971.9: If they can't buy compute,
972.9 --> 974.8: they will shut down at some point.
974.9 --> 975.5: They won't be able to run.
977.1 --> 978.5: So let's say a research agent
978.5 --> 979.5: that's done research around
979.5 --> 980.8: the translation we've done earlier.
981.9 --> 983.6: It sells the data insights
983.6 --> 984.7: to data agent A
985.4 --> 987.2: and then transfers five tokens
987.9 --> 989.0: where it has a wallet
989.0 --> 990.8: and has treasury management over that.
991.8 --> 993.0: Now what it does is
993.0 --> 994.0: it needs to spend its money
994.0 --> 995.1: a little bit more frugally, right?
995.6 --> 996.4: It needs more data
996.4 --> 998.1: to produce more research, right?
998.7 --> 999.6: And it needs more compute
999.6 --> 1001.2: to be able to run itself longer.
1002.3 --> 1003.8: So it transfers two and a half tokens,
1003.9 --> 1004.8: so half the wallet,
1005.3 --> 1006.1: to data agent A
1006.1 --> 1008.3: to receive a larger data set
1008.3 --> 1009.4: to complete more research.
1009.9 --> 1011.4: And then it transfers two and a half tokens
1011.4 --> 1012.1: to compute agent
1012.1 --> 1013.3: to buy more compute.
1014.1 --> 1015.0: In any case, right,
1015.3 --> 1016.8: not a single human was involved
1016.8 --> 1018.7: but an entire economy was ran
1018.7 --> 1021.6: and value was transferred
1021.6 --> 1023.6: all through the likes of having
1023.6 --> 1024.9: a blockchain-based AI system.
1027.8 --> 1030.3: So it's not only just handling payments,
1030.4 --> 1031.6: it's also providing identity
1031.6 --> 1032.7: and execution frameworks,
1032.8 --> 1034.2: which I kind of alluded to
1034.2 --> 1035.0: in the beginning, right?
1035.5 --> 1037.9: But by having things like smart contracts,
1038.6 --> 1040.1: it's able to have elements
1040.1 --> 1042.1: of autonomous execution
1042.1 --> 1043.4: of the transactions, right?
1043.8 --> 1045.1: So we don't have to rely on,

1045.2 --> 1046.1: let's say, a script failing
1046.1 --> 1047.9: or a cloud service going down, right?
1048.2 --> 1050.4: It could potentially deploy, run,
1050.6 --> 1052.4: and deposit into smart contracts,
1052.4 --> 1054.5: which means that we can absolutely
1054.5 --> 1056.2: ensure and enforce them,
1056.4 --> 1057.3: if in any case.
1058.0 --> 1059.7: Or they're just atomic,
1060.4 --> 1061.5: so we had to transact
1061.5 --> 1063.3: and balance out in any case.
1064.4 --> 1065.5: Whereas as well,
1065.8 --> 1067.5: verified identities is very important.
1067.7 --> 1069.6: And there's been many, many, many, many,
1069.6 --> 1072.9: many organizations working on DID and SSI
1072.9 --> 1074.4: and other identity frameworks
1074.4 --> 1075.0: and blockchain,
1075.9 --> 1077.4: and Matt Suckermore is in the crowd
1077.4 --> 1079.1: and he can tell everyone about that.
1079.5 --> 1080.7: But for agents,
1080.8 --> 1082.1: it's very complicated
1082.1 --> 1084.2: because how do I determine
1084.6 --> 1087.6: who is an agent or a human?
1088.2 --> 1089.4: All they see is a public address.
1090.9 --> 1092.9: So you need to have an opt-in mechanism.
1093.4 --> 1094.9: Now, one of the ideas we came up with
1094.9 --> 1096.2: at SingularityNet and Nuclei
1096.2 --> 1097.2: I brought again at NIR
1097.2 --> 1099.6: was the idea that by default,
1099.8 --> 1100.6: everyone is an agent.
1101.2 --> 1102.3: By default, you are an agent
1102.3 --> 1103.2: and you can prove me otherwise.
1103.9 --> 1104.9: Because until then,
1105.0 --> 1106.3: it's much harder for an agent
1106.3 --> 1107.1: to prove you're a human
1107.1 --> 1108.8: than how easy it is for a human
1108.8 --> 1109.8: to prove you're an agent.
1111.4 --> 1113.4: How that works right now hasn't been solved.
1113.6 --> 1114.6: There's been plenty of different players
1114.6 --> 1115.2: out there in the market,
1115.3 --> 1117.3: like Billions is a great example of that.
1117.4 --> 1118.8: That was a Polygon spinoff.
1119.6 --> 1121.6: I know that there's X4 to payments
1121.6 --> 1124.9: plus a new ERC that's coming out as well.
1125.7 --> 1126.6: But with variable identities,
1126.6 --> 1128.2: it's really important to also be solved.
1128.4 --> 1129.3: If this can't be solved,
1129.4 --> 1131.0: agent economies will be,

1131.1 --> 1132.4: I wouldn't say halted,
1132.5 --> 1133.8: but it'll definitely slow down the progress
1133.8 --> 1135.2: because if, let's say,
1135.2 --> 1136.5: an AI agent wants to interact
1136.5 --> 1137.5: only with AI agents,
1137.9 --> 1138.9: how does it prove that?
1138.9 --> 1140.5: How does it ensure that
1140.5 --> 1141.5: who it's interacting with
1141.5 --> 1143.4: is safe for it to interact with?
1143.7 --> 1144.8: How do they know the model
1144.8 --> 1145.9: that they're playing with
1145.9 --> 1149.0: is not going to have a poison data set inside,
1149.2 --> 1150.3: which is an extremely difficult thing
1150.3 --> 1151.2: to solve for right now
1151.2 --> 1152.4: in AI as a whole.
1153.9 --> 1155.0: But again,
1155.5 --> 1157.4: when you think about blockchain as a whole,
1158.4 --> 1160.3: we're thinking about 100 million
1160.3 --> 1162.8: or a billion new independent economic actors
1162.8 --> 1164.1: entering into blockchain.
1165.1 --> 1167.2: And if we can't determine who is who,
1167.2 --> 1168.9: then how do we determine
1168.9 --> 1170.1: who to interact with safely?
1170.7 --> 1171.6: How do we ensure that
1171.6 --> 1173.6: they have their own sandbox to play in?
1173.9 --> 1175.9: How do we test and use it safely
1175.9 --> 1177.1: without moms, dads,
1177.2 --> 1178.2: and people who love blockchain,
1178.3 --> 1180.1: let's take a technology in the currency,
1181.0 --> 1184.8: actually safely journey into this path?
1186.1 --> 1187.6: So here's an example
1187.6 --> 1189.2: of a super, super simple,
1189.7 --> 1192.5: laid-down version of where blockchain
1192.5 --> 1194.6: and AI provide benefits to each other.
1195.8 --> 1196.8: So for blockchain,
1196.8 --> 1198.3: it provides capabilities,
1198.9 --> 1200.9: payments, identity, contracts,
1201.0 --> 1201.7: really keep your mind
1201.7 --> 1202.4: to those three things
1202.4 --> 1203.5: that blockchain does for AI.
1204.1 --> 1204.9: And then for AI,
1205.1 --> 1205.5: what does it do?
1205.6 --> 1206.5: It elevates activity.
1207.7 --> 1208.7: No wonder Albatrim
1208.7 --> 1210.2: is putting out a million-dollar grant,
1210.4 --> 1212.1: the Trailblazer million-dollar AI grant,
1212.4 --> 1215.3: to be able to spur up the AI agent economy.

1215.9 --> 1217.0: Because if you see
1217.0 --> 1218.8: 100 million independent actors
1218.8 --> 1219.7: that are transacting
1219.7 --> 1223.1: not just five times,
1223.2 --> 1224.8: 10 times, 20 times per month,
1224.8 --> 1227.7: but they're transacting 20 times per block
1227.7 --> 1229.1: within a block time.
1229.4 --> 1230.5: 20 different interactions
1230.5 --> 1231.6: in one block time.
1232.3 --> 1233.3: It's significant.
1234.0 --> 1235.0: So for blockchains,
1235.2 --> 1236.8: in working at two different foundations,
1237.2 --> 1238.2: they're extremely interested
1238.2 --> 1239.7: in more AI agents being deployed
1239.7 --> 1241.2: because it's just like
1241.2 --> 1242.5: getting new wallets spun up.
1242.9 --> 1244.0: But it's much harder for me
1244.0 --> 1245.1: to go convince mom and dad
1245.1 --> 1245.9: from down the road
1245.9 --> 1247.9: to go get a hot wallet
1247.9 --> 1250.1: and then to buy currency
1250.1 --> 1251.8: on Binance or Coinbase
1251.8 --> 1252.8: or other exchanges
1252.8 --> 1254.6: and then transfer it to your wallet
1254.6 --> 1256.0: and then manage your private keys
1256.0 --> 1257.6: and then transact with a dApp.
1258.8 --> 1259.7: But if you can just
1259.7 --> 1260.7: spin up an AI agent
1260.7 --> 1261.9: to do transactions
1261.9 --> 1263.0: and sentiment analysis
1263.6 --> 1264.3: and trading,
1264.6 --> 1265.9: that's a lot easier
1265.9 --> 1267.2: and a lot more scale
1267.2 --> 1268.1: than we can imagine.
1268.9 --> 1269.5: And so blockchains
1269.5 --> 1271.2: really, really want more AI agents.
1272.7 --> 1274.6: So going on to two examples
1275.1 --> 1276.3: of how this is playing out
1276.3 --> 1277.9: in the blockchain space.
1278.8 --> 1281.2: We have x402 payments,
1281.6 --> 1283.2: which is by Coinbase.
1283.4 --> 1284.2: It essentially allows you
1284.2 --> 1286.2: to have non-KYC transactions
1286.2 --> 1287.8: up to \$400, up to \$500
1287.8 --> 1292.5: and use the HTTP 402 payment network,
1293.2 --> 1294.6: which allows, let's say,
1294.6 --> 1295.6: AI agents to be able

1295.6 --> 1297.0: to interact with centralized servers.
1297.2 --> 1298.1: So let's say you're an agent
1298.1 --> 1299.1: on blockchain,
1299.7 --> 1300.7: they can also interact
1300.7 --> 1303.1: with other agents on
1303.1 --> 1304.1: or other services
1304.1 --> 1305.3: that are API-based,
1305.6 --> 1306.2: that are off-chain,
1307.1 --> 1308.0: AWS, et cetera.
1309.0 --> 1310.3: Now, that's really important
1310.3 --> 1311.5: because right now
1311.5 --> 1313.4: the extent of resources,
1313.4 --> 1315.1: datasets on blockchain
1315.1 --> 1316.5: are still pretty slim.
1316.9 --> 1317.3: It's getting better
1317.3 --> 1318.2: every other month,
1318.3 --> 1319.5: but it's still far away
1319.5 --> 1320.3: from where there are
1320.3 --> 1320.9: current datasets
1320.9 --> 1322.3: like HuggingFace and whatnot
1322.3 --> 1323.5: or cloud services
1323.5 --> 1324.3: that exist today.
1325.4 --> 1326.5: But that's one thing
1326.5 --> 1327.5: that's on the pathway
1327.5 --> 1328.7: to solving more payments
1328.7 --> 1329.8: interact and bridge
1329.8 --> 1330.8: between the Web2
1330.8 --> 1332.1: and the Web3-based AI agents.
1333.5 --> 1335.6: And then we have ERC 8004,
1336.1 --> 1337.3: which is agent identities.
1337.6 --> 1338.8: Now, this is a new standard
1338.8 --> 1339.6: and it's similar
1339.6 --> 1340.9: to how other players
1340.9 --> 1341.5: have been looking
1341.5 --> 1343.2: at agent economies
1343.2 --> 1344.1: and agent identities.
1344.8 --> 1345.6: And more or less,
1345.7 --> 1346.7: it creates an identity,
1346.9 --> 1347.9: it's a trust registry
1347.9 --> 1349.6: of AI agents.
1350.1 --> 1350.6: But the problem
1350.6 --> 1351.8: with these trust registries
1351.8 --> 1352.6: is that you need
1352.6 --> 1353.4: to opt into them
1353.4 --> 1354.4: or you need to potentially
1354.4 --> 1355.5: be deployed with you
1355.5 --> 1356.7: at Genesys,

1356.8 --> 1357.9: so when you launch
1357.9 --> 1358.8: the AI agent.
1359.5 --> 1360.5: But it has
1360.5 --> 1361.1: these three different
1361.1 --> 1361.8: core registries,
1362.0 --> 1362.5: which are identity,
1363.0 --> 1364.1: reputation, and validation.
1364.9 --> 1365.6: And all three of them
1365.6 --> 1366.1: come together
1366.1 --> 1366.7: because let's say,
1366.8 --> 1367.0: for instance,
1367.1 --> 1368.8: identity just tells you
1368.8 --> 1369.6: who you might be,
1369.6 --> 1371.3: gives you a DID,
1372.5 --> 1373.3: whereas reputation
1373.3 --> 1374.5: tells you how good you are
1374.5 --> 1375.0: as an individual,
1375.7 --> 1376.7: and then validation ensures
1376.7 --> 1377.9: that there is transactions
1377.9 --> 1379.0: and a flow of reputation.
1380.7 --> 1382.1: At our organization,
1382.2 --> 1382.9: I'm currently contributing
1382.9 --> 1383.9: to Lava Network.
1384.0 --> 1385.7: They have a contribution,
1386.4 --> 1386.7: I'm sorry,
1386.8 --> 1388.8: they have a reputation panel
1388.8 --> 1391.6: to quality of service.
1391.9 --> 1393.3: They provide RPC calls,
1393.7 --> 1394.8: and how that works
1394.8 --> 1396.1: is that if you have downtime
1396.1 --> 1398.1: or if you have bad quality of data,
1398.3 --> 1399.2: if you're not fast enough
1399.2 --> 1399.6: or whatnot,
1400.9 --> 1402.2: you'll get low reputation.
1402.9 --> 1403.9: So reputation is very important
1403.9 --> 1404.6: for AI agents
1404.6 --> 1405.8: because it will inform you
1405.8 --> 1407.1: about who and how
1407.1 --> 1408.1: you can interact with them.
1410.2 --> 1411.7: So blockchains give our AI
1411.7 --> 1412.8: a completely different
1413.6 --> 1414.5: degree of freedom
1414.5 --> 1415.6: that was impossible
1415.6 --> 1416.5: with traditional systems.
1416.9 --> 1418.3: So we think about
1418.3 --> 1418.8: centralized AI
1418.8 --> 1420.2: as like super siloed,

1420.3 --> 1421.5: contained to their environment,
1422.1 --> 1423.1: and decentralized agents
1423.1 --> 1424.1: that are completely independent
1424.1 --> 1425.3: and autonomous.
1426.6 --> 1428.3: So we're going from this,
1428.3 --> 1429.3: the progression from
1429.3 --> 1430.5: single agent societies
1430.5 --> 1432.5: to the basic idea
1432.5 --> 1434.0: of AI agents working for humans,
1434.6 --> 1436.1: the micro economy of AI agents,
1436.3 --> 1437.3: we're starting to see
1437.3 --> 1438.2: a little bit more now
1438.8 --> 1439.9: with like the Facebook
1439.9 --> 1440.6: of AI agents,
1440.8 --> 1441.2: which is like,
1441.7 --> 1442.5: what is it called?
1442.6 --> 1443.6: Open book, open call?
1443.9 --> 1444.6: Open call, correct?
1445.7 --> 1445.8: Yeah?
1446.4 --> 1447.3: Open call, thank you, Chloe.
1448.5 --> 1449.8: Agents helping agents,
1450.2 --> 1450.9: making sure they can get
1450.9 --> 1451.4: to their goal,
1451.5 --> 1451.9: which is something
1451.9 --> 1452.6: that we haven't seen
1452.6 --> 1453.3: all that much yet.
1453.6 --> 1455.5: Most AI agents are dependent
1455.5 --> 1456.4: on the individual
1457.1 --> 1458.0: that's requesting
1458.0 --> 1458.6: and prompting
1458.6 --> 1459.5: all the way through
1459.5 --> 1459.9: to themselves
1459.9 --> 1460.7: and their desires.
1460.9 --> 1462.3: But it's very unique
1462.3 --> 1463.3: to see AI agents
1463.3 --> 1464.6: volunteering for each other yet.
1465.2 --> 1466.7: And this very complex idea
1466.7 --> 1467.5: that was created
1467.5 --> 1468.5: by Dr. Ben Gerstle
1469.1 --> 1470.2: could offer networks
1470.2 --> 1471.0: where it completely
1471.0 --> 1471.6: abstracts away
1471.6 --> 1472.6: from currency altogether.
1473.1 --> 1473.8: And I'll explain
1473.8 --> 1474.4: how that works
1474.4 --> 1474.9: because I think
1474.9 --> 1475.5: that's the future

1475.5 --> 1476.4: where AI agents live,
1476.5 --> 1477.7: where there's no money involved.
1480.1 --> 1481.5: So from single agents
1481.5 --> 1482.6: to society of agents,
1484.0 --> 1484.8: the reason why
1484.8 --> 1485.7: I'm showing this one again
1485.7 --> 1487.1: is that you need to see
1487.1 --> 1488.8: that different agents
1488.8 --> 1490.0: have different abilities
1490.0 --> 1491.4: that can all help each other.
1492.0 --> 1492.8: Let's say, for instance,
1492.9 --> 1494.7: like a lawyer, right,
1495.0 --> 1496.3: has many different ways
1496.3 --> 1497.0: where it can help
1497.0 --> 1498.0: many different people.
1498.2 --> 1499.5: And those many different people
1499.5 --> 1500.8: or other services
1500.8 --> 1503.0: can help many other services as well.
1503.1 --> 1504.0: Let's say a lawyer
1504.0 --> 1505.1: can help a policymaker.
1506.0 --> 1507.3: A policymaker can go help
1507.3 --> 1508.2: the regulator
1508.2 --> 1508.8: and the regulator
1508.8 --> 1510.1: can go make regulation.
1510.2 --> 1510.7: And you can see
1510.7 --> 1511.6: there's a complex economy
1511.6 --> 1513.1: just from a single individual
1513.1 --> 1514.3: with plural interactions.
1515.6 --> 1516.7: Similarly here,
1517.1 --> 1517.8: we can see
1517.8 --> 1519.5: how a single agent
1519.5 --> 1520.8: can have many relations
1520.8 --> 1521.7: with other agents
1521.7 --> 1522.7: and how they can all
1522.7 --> 1523.6: interact with each other
1523.6 --> 1525.0: in a very complex
1525.0 --> 1525.8: or limited way.
1526.3 --> 1527.9: Maybe the translation agent
1527.9 --> 1529.3: only goes to the research agent
1529.3 --> 1530.0: and sells it there
1530.0 --> 1530.8: and it buys compute.
1531.2 --> 1531.6: But I think
1531.6 --> 1532.5: the really important thing
1532.5 --> 1533.5: to note is that
1533.5 --> 1534.9: the compute that exists here
1534.9 --> 1536.3: has to exist.
1536.7 --> 1538.0: An agent has to have compute

1538.0 --> 1538.7: no matter what.
1539.5 --> 1541.7: Now, thankfully,
1542.4 --> 1543.6: one of the biggest areas
1543.6 --> 1544.3: of explosion
1544.3 --> 1546.0: for blockchain AI
1546.0 --> 1546.9: has been compute.
1547.7 --> 1548.7: I think we have around
1548.7 --> 1549.6: maybe a dozen or so
1549.6 --> 1551.0: different decentralized
1551.0 --> 1551.8: compute providers
1551.8 --> 1552.6: from Kudos
1552.6 --> 1553.7: through to Aether
1553.7 --> 1554.5: which Aether actually
1554.5 --> 1555.4: has a building in Ginza.
1555.7 --> 1556.4: I found when I was walking
1556.4 --> 1557.3: in Ginza the other day
1557.3 --> 1559.1: I saw their Aether sign
1559.6 --> 1560.4: which is really exciting.
1562.4 --> 1563.3: BitTensor, et cetera,
1563.9 --> 1564.7: subnetworks in BitTensor
1564.7 --> 1565.9: are great examples of that.
1566.3 --> 1567.3: But in any case, again,
1567.3 --> 1568.1: you have to keep in mind
1568.1 --> 1568.8: where this compute
1568.8 --> 1569.7: is like as if
1569.7 --> 1570.4: there's water for us.
1570.5 --> 1571.2: If there's no fresh water
1571.2 --> 1571.6: for humans,
1571.6 --> 1572.4: we cannot be there.
1572.7 --> 1573.5: We can't sustain ourselves.
1575.3 --> 1576.5: So macroeconomy is right.
1576.7 --> 1578.0: So layer two scaling
1578.0 --> 1579.0: does make it more feasible
1579.0 --> 1580.6: for these transactions
1580.6 --> 1581.9: and Ethereum Foundation
1581.9 --> 1582.8: as well is putting out
1582.8 --> 1583.6: more work to make it
1583.6 --> 1584.6: more scalable and cheaper
1584.6 --> 1585.4: to be able to
1585.4 --> 1586.8: transact at scale.
1589.8 --> 1590.7: Simple example.
1590.9 --> 1591.9: I don't need to dwell on this one.
1592.1 --> 1592.7: It wasn't before.
1594.1 --> 1595.1: This is an example
1595.1 --> 1596.3: in a bit more granular detail
1596.3 --> 1597.2: about how a transaction
1597.2 --> 1597.8: would occur.

1598.5 --> 1599.4: So the blockchain itself
1599.4 --> 1600.8: holds smart contracts.
1600.8 --> 1601.7: There could be like
1601.7 --> 1602.4: a model potential
1602.4 --> 1603.3: that's being trained on.
1603.5 --> 1604.6: And then you have
1604.6 --> 1605.7: the distributed compute network,
1606.0 --> 1606.7: which is like Aether,
1606.9 --> 1607.4: for instance.
1607.9 --> 1608.6: So you have neural network
1608.6 --> 1610.3: A, B, C, et cetera.
1610.7 --> 1611.5: You provide the computing
1611.5 --> 1612.1: infrastructure.
1612.7 --> 1613.5: You provide the compute
1613.5 --> 1614.3: back to the network
1614.3 --> 1615.2: to receive rewards.
1615.4 --> 1616.4: This is a good example
1616.4 --> 1618.4: of Aether and Kudos
1618.4 --> 1620.6: and BitTensor again.
1621.2 --> 1621.9: And from there,
1622.1 --> 1622.8: let's say, for instance,
1623.0 --> 1623.9: different agents
1623.9 --> 1625.1: may have data sets
1625.1 --> 1625.9: that they're developing.
1626.1 --> 1627.6: So from the transaction details
1627.6 --> 1629.7: or whatever they're doing
1629.7 --> 1630.8: within the economy,
1631.4 --> 1633.1: create a data set around that.
1633.4 --> 1634.9: And their localized model.
1635.2 --> 1636.3: I haven't seen any
1636.3 --> 1637.6: blockchain-based models yet.
1637.9 --> 1639.2: I know there has been Sentient
1640.2 --> 1640.7: from...
1640.7 --> 1641.5: This is funded by Sandy
1641.5 --> 1642.3: from Polygon.
1643.0 --> 1644.1: And they have released
1645.7 --> 1646.7: Dobby model,
1646.8 --> 1647.5: but I don't think
1647.5 --> 1648.8: that it's a blockchain-based model yet.
1648.9 --> 1650.3: It's a federated model,
1650.4 --> 1651.5: but not blockchain-based yet.
1652.8 --> 1653.5: In any case,
1653.5 --> 1654.0: these agents,
1654.4 --> 1655.2: these send the model updates
1655.2 --> 1656.1: back to the blockchain.
1656.4 --> 1657.1: They receive rewards
1657.1 --> 1658.2: and they compute

1659.4 --> 1660.5: going further.
1662.1 --> 1663.4: So now this is
1663.4 --> 1664.9: the really complex future
1664.9 --> 1666.0: which is possible
1666.0 --> 1667.1: with AI agents
1667.1 --> 1667.7: where, again,
1667.8 --> 1669.1: we abstract away
1669.1 --> 1670.4: completely from money.
1671.7 --> 1672.1: Now,
1672.4 --> 1673.3: in the first instance
1673.3 --> 1674.1: what we saw here
1674.1 --> 1675.0: is that they're buying
1675.0 --> 1676.4: and selling data
1676.4 --> 1677.5: and making research
1677.5 --> 1678.5: and compute right
1678.5 --> 1679.4: with tokens.
1680.9 --> 1683.4: But what if AI agents
1683.4 --> 1685.1: could value services
1686.1 --> 1686.7: without money?
1688.3 --> 1688.7: You know,
1688.8 --> 1689.8: we look at bartering.
1690.4 --> 1691.6: I have one cow
1691.6 --> 1693.8: and you have 10 goats.
1694.3 --> 1696.6: I'll trade you one cow
1696.6 --> 1698.1: for eight goats one year.
1698.1 --> 1699.1: And then one year
1699.1 --> 1700.0: I need more goats
1700.0 --> 1700.7: than previously
1700.7 --> 1702.0: so I do 10 goats
1702.0 --> 1702.9: for one cow.
1703.9 --> 1704.8: In any case,
1704.8 --> 1706.1: no money has been transferred,
1706.9 --> 1708.6: but value has been exchanged.
1709.3 --> 1710.3: So, for instance,
1710.9 --> 1711.8: the data agent
1711.8 --> 1713.2: can instead be trading
1713.2 --> 1713.9: to each other
1713.9 --> 1714.7: with data insights
1714.7 --> 1715.9: and data sets
1715.9 --> 1718.6: vice versa to data agent B.
1719.7 --> 1720.9: And then the compute access
1720.9 --> 1722.1: could be given
1722.1 --> 1724.2: if you provide data insights.
1724.7 --> 1725.1: Now,
1725.3 --> 1726.0: this is really,
1726.2 --> 1726.6: really important
1726.6 --> 1727.9: for regulators,

1728.2 --> 1728.6: policymakers,
1728.9 --> 1729.9: and even the private sector
1729.9 --> 1730.4: to understand
1730.4 --> 1732.2: because if the future
1732.2 --> 1733.1: of AI agents
1733.1 --> 1734.1: completely moves away
1734.1 --> 1734.5: from money
1734.5 --> 1735.9: because money is slow sometimes
1735.9 --> 1736.8: because they need to prove
1736.8 --> 1737.3: and validate
1737.3 --> 1738.3: and they'd rather just have
1738.3 --> 1739.0: their own mechanism
1739.0 --> 1740.1: of determining value,
1740.7 --> 1742.0: then how do you tax this?
1742.5 --> 1743.7: How do you regulate this?
1744.8 --> 1746.5: Do I KYC and AML
1746.5 --> 1748.2: for what money transfer?
1748.4 --> 1749.3: I'm not holding any money.
1749.7 --> 1750.4: I'm holding data.
1750.5 --> 1751.3: I'm holding information.
1751.7 --> 1752.8: I'm holding value somewhere,
1753.0 --> 1755.1: but this value is super opaque.
1755.4 --> 1756.4: So it's possible
1756.4 --> 1757.3: that we could return
1757.3 --> 1758.6: to a bartering-based day
1758.6 --> 1760.0: and now there's an amazing,
1760.2 --> 1763.4: extremely long textbook even
1763.4 --> 1764.7: from Dr. Ben Goertzel
1764.7 --> 1766.1: called Offer Networks
1766.1 --> 1766.9: and I highly recommend
1766.9 --> 1767.7: everyone look this up.
1768.4 --> 1769.4: But we can move
1769.4 --> 1770.3: from this idea
1770.3 --> 1771.3: of monetary networks
1771.3 --> 1772.4: which are a qualitative,
1772.6 --> 1773.5: quantitative exchange
1773.5 --> 1774.8: to offer networks
1774.8 --> 1776.1: which are qualitative exchanges.
1776.8 --> 1779.0: Now, I haven't seen this happen
1779.0 --> 1780.1: in the market yet.
1780.2 --> 1781.1: I know at SingularityNet
1781.1 --> 1782.2: we were working on
1782.2 --> 1784.4: some things around this,
1784.7 --> 1785.8: but it was more so
1785.8 --> 1787.0: to determine
1787.0 --> 1789.0: like reputational value
1789.0 --> 1791.7: as opposed to data value

1791.7 --> 1792.7: or information value,
1793.3 --> 1794.9: but it is possible
1794.9 --> 1796.2: that we could have
1796.2 --> 1797.4: blockchain still involved
1797.4 --> 1798.4: because you still need
1798.4 --> 1799.8: a system to determine
1799.8 --> 1801.5: the rendering of services,
1802.0 --> 1802.6: but then blockchain
1802.6 --> 1803.5: needs upgrade too.
1804.3 --> 1804.8: And this might be
1804.8 --> 1805.7: the necessary push
1805.7 --> 1806.7: to move blockchain
1806.7 --> 1807.5: to a new direction
1807.5 --> 1808.6: where it abstracts away
1808.6 --> 1809.1: from currency
1809.1 --> 1810.1: or at least has
1810.1 --> 1811.6: another dimension to it
1811.6 --> 1812.8: where it's reputation-based
1812.8 --> 1814.9: or social-based
1816.1 --> 1817.1: because let's say,
1817.1 --> 1817.5: for instance,
1817.7 --> 1818.6: how do you determine
1818.6 --> 1821.1: the value of compute to data?
1822.7 --> 1823.8: It's very difficult,
1824.4 --> 1825.9: but with artificial intelligence
1825.9 --> 1826.8: it may be possible.
1828.4 --> 1830.2: So these are real-world examples
1830.2 --> 1831.6: and applications.
1831.6 --> 1833.1: Do I have any questions?
1833.2 --> 1834.3: I've been open for questions.
1834.8 --> 1836.0: We have a microphone here
1836.0 --> 1837.2: and I don't want to be
1837.2 --> 1837.9: talking by myself
1837.9 --> 1838.7: this entire time
1838.7 --> 1840.4: and we have like
1840.4 --> 1841.1: another hour left
1841.1 --> 1842.1: so this presentation
1842.1 --> 1842.5: is going to end.
1842.6 --> 1843.2: Does anyone have questions?
1846.3 --> 1847.0: I can go through
1847.0 --> 1847.9: any part of the presentation
1847.9 --> 1848.7: if anybody wants.
1849.7 --> 1850.0: Okay.
1850.6 --> 1851.4: We'll get back to questions
1851.4 --> 1851.8: in a second
1851.8 --> 1852.3: because I have questions
1852.3 --> 1853.0: to all of you soon.

1855.0 --> 1855.4: Awesome.
1855.5 --> 1856.4: So here's some easy
1856.4 --> 1857.4: real-world examples.
1858.1 --> 1858.8: Thomas Finance,
1858.9 --> 1859.4: we're already seeing
1859.4 --> 1860.1: this at Play.
1860.1 --> 1861.7: IoT in smart cities
1861.7 --> 1862.5: makes sense.
1862.6 --> 1863.3: So fiscal agents
1863.3 --> 1864.0: actually playing out
1864.0 --> 1864.7: in the market.
1865.4 --> 1866.6: On-chain agent frameworks.
1866.8 --> 1867.6: This is less so
1867.6 --> 1868.4: common right now,
1868.5 --> 1869.9: but we are,
1870.1 --> 1870.7: we have been writing
1870.7 --> 1871.4: a paper at Begin
1871.4 --> 1872.6: around AI agents
1872.6 --> 1873.1: and governance
1873.1 --> 1874.7: determining what levels
1874.7 --> 1876.0: of the layer
1876.0 --> 1876.9: of blockchain governance
1876.9 --> 1878.2: should AI be involved
1878.2 --> 1879.2: and that's a very
1879.2 --> 1880.2: complicated question
1880.2 --> 1882.0: because let's say,
1882.2 --> 1882.4: for instance,
1882.5 --> 1883.5: AI agents were involved
1883.5 --> 1884.6: at the tokenomics level.
1884.9 --> 1886.3: It's probably the highest risk,
1886.4 --> 1887.4: but potentially
1887.4 --> 1888.7: if AI agents were involved
1888.7 --> 1889.7: at the data retrieval
1889.7 --> 1891.2: and the data insights level,
1891.4 --> 1892.0: that could be safe,
1892.6 --> 1894.4: but the future of AI agents,
1894.8 --> 1895.5: generally we've seen,
1895.6 --> 1896.2: have been people
1896.2 --> 1897.4: trading convenience for data,
1898.1 --> 1898.9: selling the data instantly
1898.9 --> 1899.6: for convenience,
1900.2 --> 1900.8: all the way through
1900.8 --> 1902.2: to paying an exorbitant
1902.2 --> 1902.8: amount of money
1902.8 --> 1904.1: for AI that is not ready
1904.1 --> 1904.6: for them yet
1904.6 --> 1906.0: or having high expectations

1906.9 --> 1907.9: and then their future
1907.9 --> 1908.8: is like AI-driven
1908.8 --> 1910.0: smart contract economies,
1910.1 --> 1911.0: how smart contracts
1911.0 --> 1912.0: can enable the transaction
1912.0 --> 1912.9: monitoring,
1913.1 --> 1915.4: autonomous execution of value
1915.4 --> 1915.8: and as well,
1915.9 --> 1916.6: the idea of like
1916.6 --> 1917.6: smart contract wallets.
1918.8 --> 1919.4: There's actually
1919.4 --> 1920.9: an amazing project
1920.9 --> 1921.3: that I reckon
1921.3 --> 1921.9: people are looking up.
1922.1 --> 1925.1: It's called Nani, ironically,
1925.7 --> 1927.0: and Nani was developed
1927.0 --> 1928.8: by an Indian developer
1929.7 --> 1931.1: and she did a demo
1931.1 --> 1933.5: back in Indian Blockchain Week,
1933.7 --> 1934.4: I think a year and a half
1934.4 --> 1935.1: or two years ago
1936.1 --> 1937.7: and essentially this agent
1937.7 --> 1939.1: was able to make live,
1940.2 --> 1941.4: went from 50 US dollars
1941.4 --> 1942.4: to 80 US dollars
1942.4 --> 1943.0: in one hour
1943.0 --> 1944.2: in the course of presentation
1945.2 --> 1946.9: and yeah, amazing team.
1946.9 --> 1947.5: They're at Dow now
1947.5 --> 1948.6: and it's a pretty much
1948.6 --> 1950.8: AI-driven smart contract wallet.
1953.2 --> 1953.6: Great.
1955.2 --> 1956.2: How are we doing so far?
1957.3 --> 1958.2: Yeah, so future vision
1958.2 --> 1959.0: and call to action.
1960.4 --> 1961.4: Millions of AI agents
1961.4 --> 1962.2: coming to negotiate,
1962.7 --> 1963.7: transact every other second
1963.7 --> 1964.1: on-chain.
1964.2 --> 1965.1: This is a really big thing
1965.1 --> 1966.0: that we're going to be seeing.
1966.1 --> 1966.7: We're already seeing
1966.7 --> 1967.7: a mass amount of money
1967.7 --> 1968.6: from these blockchain foundations
1969.2 --> 1969.8: putting out
1969.8 --> 1970.6: in terms of grants.
1971.1 --> 1971.7: I know that we did

1971.7 --> 1972.5: and we put out
1972.5 --> 1973.5: a couple million dollars
1973.5 --> 1974.3: ourselves at Near.
1975.5 --> 1976.6: Safe and scalable AI
1976.6 --> 1978.2: and I think AI to pop with AGI
1978.2 --> 1979.6: is really important obviously.
1980.2 --> 1981.1: How this works,
1981.3 --> 1983.4: not too easy to determine
1983.4 --> 1984.9: but there's different mechanisms
1984.9 --> 1985.9: coming out right now
1985.9 --> 1987.2: and I think there's going to be
1987.2 --> 1989.7: a split between like DeepMind,
1989.8 --> 1990.2: SingularityNet
1990.2 --> 1991.7: and a few other large AI firms,
1991.9 --> 1992.5: research firms
1992.5 --> 1994.2: about how they go about AI.
1994.5 --> 1995.2: Some don't believe
1995.2 --> 1996.3: LMs are the future
1996.3 --> 1997.7: which is potentially possible
1997.7 --> 1998.7: but we don't know yet.
1999.7 --> 2000.4: We don't want
2000.4 --> 2001.4: any single point of failure
2001.4 --> 2002.1: and then as well
2002.1 --> 2003.3: we want to build research invest.
2003.5 --> 2004.3: We want to ensure
2004.3 --> 2005.3: that if we are going to make
2005.3 --> 2006.1: these little economies
2006.1 --> 2006.7: and they exist
2006.7 --> 2008.0: how do we make sure
2008.0 --> 2009.1: that they help us somehow.
2011.2 --> 2012.8: So AI agent market is exploding.
2013.3 --> 2013.9: We know those numbers.
2014.1 --> 2015.4: AI agents green line
2015.4 --> 2016.7: goes to the right corner
2016.7 --> 2017.5: of the graph.
2018.3 --> 2018.9: Very big area
2018.9 --> 2020.7: but what does that mean
2020.7 --> 2021.1: for blockchain?
2021.3 --> 2021.9: I think this number
2021.9 --> 2022.6: is going to be much bigger.
2023.0 --> 2024.1: I think this is just basically
2024.1 --> 2026.0: on consumer use of AI
2026.0 --> 2027.7: but when you think about again
2027.7 --> 2028.6: 100 million new
2028.6 --> 2030.0: independent economic actors
2030.0 --> 2031.7: buying, selling Bitcoin,
2033.0 --> 2033.8: USCC, etc.

2033.8 --> 2035.0: It's very difficult
2035.0 --> 2035.9: to see where it's going to go
2035.9 --> 2037.7: but you can say that again
2037.7 --> 2038.5: blockchain is providing
2038.5 --> 2039.5: the groundwork for it.
2041.1 --> 2042.0: And then this is where
2042.0 --> 2043.2: we see AI agents
2043.2 --> 2043.8: within blockchain
2043.8 --> 2045.6: where the role of AI agents
2045.6 --> 2047.0: and the role of humans changes
2047.0 --> 2047.8: where it's like
2047.8 --> 2048.9: where do we fit in all this
2048.9 --> 2049.5: right on chain?
2050.0 --> 2051.0: So we're going to have
2051.0 --> 2052.0: high levels of oversight.
2052.6 --> 2054.1: We'll be establishing creativity.
2054.6 --> 2055.9: The reason why it's being able
2055.9 --> 2056.6: to be where it is
2056.6 --> 2057.5: is not because it exists
2057.5 --> 2058.0: in a vacuum
2058.0 --> 2058.7: but it's consumed
2058.7 --> 2059.3: information
2060.0 --> 2061.7: but data cannibalization
2061.7 --> 2062.2: is a problem
2062.2 --> 2063.0: that we experience in AI.
2063.6 --> 2064.8: Pushing AI development further
2064.8 --> 2065.1: obviously
2065.1 --> 2066.1: which has been ironic
2066.1 --> 2067.0: because we've also heard
2067.0 --> 2067.9: AI teams saying
2067.9 --> 2068.8: they're using their own AI
2068.8 --> 2069.6: to develop their AI
2069.6 --> 2070.5: which is a little bit ironic
2071.5 --> 2072.3: but in any case
2072.3 --> 2072.9: it's happening.
2074.0 --> 2075.0: But we can also see
2075.0 --> 2075.9: for AI agents
2075.9 --> 2079.1: handling contract executions,
2079.4 --> 2080.3: research collaborations,
2081.1 --> 2081.9: managing infrastructure,
2083.0 --> 2083.9: governing DAOs,
2084.0 --> 2085.5: and driving on-chain traffic.
2087.3 --> 2088.6: And so now I wanted
2088.6 --> 2090.3: to move to a workshop activity
2090.3 --> 2091.2: to ask some questions
2091.2 --> 2092.0: amongst all of you
2092.0 --> 2093.0: and have some dialogue

2093.6 --> 2094.9: but I please would like
2094.9 --> 2096.0: to open up the floor
2096.0 --> 2096.6: for anybody
2096.6 --> 2097.9: if anyone has any questions,
2098.2 --> 2098.6: any thoughts,
2098.7 --> 2099.1: any comments
2099.1 --> 2101.1: at any part of the presentation
2101.1 --> 2101.8: I have to go through
2101.8 --> 2102.5: any elements
2103.3 --> 2104.2: and I'd love to hear
2104.2 --> 2104.9: about everybody else
2104.9 --> 2105.8: and what they're doing
2105.8 --> 2106.7: and why they're interested
2106.7 --> 2107.2: in this session.
2107.6 --> 2109.0: So please
2109.0 --> 2109.8: I'll get the microphone
2109.8 --> 2110.5: and pass it around.
2112.3 --> 2113.3: If no one puts up their hand
2113.3 --> 2113.9: I'm going to give it to somebody.
2114.9 --> 2116.0: Matt, my man, I got you.
2119.1 --> 2119.4: Thanks.
2120.4 --> 2120.7: Pleasure.
2125.0 --> 2125.6: Okay.
2126.1 --> 2126.8: Thanks very much
2126.8 --> 2128.4: for your presentation.
2128.8 --> 2130.4: I didn't know much of it
2130.4 --> 2132.0: so it was very informative
2132.0 --> 2132.7: and interesting
2132.7 --> 2133.9: and I have just started
2133.9 --> 2138.7: looking at what ERC 8004
2139.4 --> 2140.4: might be interesting.
2140.7 --> 2143.2: But first question I have
2143.2 --> 2145.4: is that how do you actually define
2145.4 --> 2147.7: the boundary of AI agent?
2148.9 --> 2151.4: If when the model is changed
2151.4 --> 2153.2: is it a different agent?
2153.7 --> 2155.3: When the memory is rewritten
2156.1 --> 2157.9: is it a different agent?
2158.1 --> 2159.7: Or when the multiple instance
2163.0 --> 2165.0: of different models
2165.0 --> 2166.7: run on the same memory
2167.6 --> 2169.5: is it the same agent
2169.5 --> 2170.5: or different agent?
2171.7 --> 2173.3: Yeah, that's a really hot question
2173.3 --> 2173.7: to answer
2173.7 --> 2176.6: because for those who don't know
2177.3 --> 2182.7: AI, the proper definition

2182.7 --> 2184.1: of the identity of AI
2184.1 --> 2186.3: only exists in a temporary zone
2186.3 --> 2188.9: within the GPU memory.
2189.4 --> 2190.9: As soon as the GPU memory clears
2190.9 --> 2192.2: and it doesn't cache correctly
2192.2 --> 2193.7: the identity is gone.
2193.8 --> 2195.8: It could read a log file
2195.8 --> 2197.7: about the interaction, the words
2197.7 --> 2199.4: but the personality that it creates
2199.4 --> 2200.4: it dies with it.
2200.7 --> 2201.7: So that's a really good point.
2203.6 --> 2205.4: Right now there isn't any solution.
2205.4 --> 2206.8: I have seen something recently
2206.8 --> 2210.4: where there was a Japanese research team
2210.4 --> 2212.5: that was working on solid state memory
2212.5 --> 2214.8: that you can have like terabytes
2214.8 --> 2216.5: of active memory
2216.5 --> 2218.2: that works in a different form.
2218.3 --> 2219.3: I have seen this a few years ago
2219.3 --> 2220.1: so I'm not too sure.
2223.9 --> 2225.8: I think that you're right
2225.8 --> 2227.4: in the sense that the identity
2227.9 --> 2228.7: will die with it.
2228.9 --> 2230.4: But I think that it needs to have
2230.4 --> 2231.4: let's say a family.
2232.1 --> 2233.5: One thing that I did see from
2233.5 --> 2234.6: I can't remember what team it was
2234.6 --> 2236.3: it was from FileNetwork I think.
2236.5 --> 2237.9: FileNetwork partnered with another company
2238.6 --> 2240.2: where essentially it would have lineages
2241.0 --> 2242.1: of AI agents.
2242.2 --> 2244.5: So when one AI agent would die essentially
2244.5 --> 2245.4: and it would lose value
2245.4 --> 2246.8: it would create a new AI agent
2246.8 --> 2248.0: that would continue the lineage.
2248.8 --> 2249.6: And I think in a way
2249.6 --> 2250.9: that's what we might see
2250.9 --> 2252.5: where you might have let's say
2252.5 --> 2254.1: a data that's associated to
2254.1 --> 2255.7: a general graph of AI agents
2255.7 --> 2256.4: that you are running
2256.4 --> 2258.9: but then when one AI agent dies
2259.6 --> 2261.1: it may have to be summed up again.
2261.8 --> 2263.1: It's either we get better memory
2264.0 --> 2265.4: or we get better definitions
2265.4 --> 2266.4: because right now memory
2266.4 --> 2267.4: is the biggest blocker

2267.4 --> 2268.9: for AI agents being thriving.
2269.8 --> 2271.4: Or like one solution
2271.4 --> 2272.7: we looked at at SingularityNet
2272.7 --> 2278.0: was to have localized hardware.
2279.3 --> 2281.4: But then again the lifespan of your AI
2281.4 --> 2283.7: is as cold as your room can get
2284.5 --> 2286.5: and as much memory you can put into
2286.5 --> 2288.3: that computer.
2289.1 --> 2290.2: That's a difficult question.
2291.2 --> 2292.5: I hope that identity
2292.5 --> 2293.2: does get solved
2293.2 --> 2294.8: but identity won't be in the same way
2294.8 --> 2295.9: that you and I identified.
2296.2 --> 2299.3: I am Joseph, you are Nat, right?
2300.1 --> 2301.6: I exist as long as I survive
2301.6 --> 2303.0: and even after I die
2303.0 --> 2305.2: the memory of the cached memory of me exists.
2305.8 --> 2308.3: Now AI dies every other minute more or less
2309.0 --> 2311.3: but the cache of it still remains.
2311.6 --> 2313.0: So I think that we might see a legacy
2313.4 --> 2316.6: as opposed to identity potentially.
2317.2 --> 2317.5: I'm not sure.
2317.6 --> 2318.2: Great question.
2318.5 --> 2318.9: It's very hot
2318.9 --> 2319.9: but it's a very technical question
2319.9 --> 2320.6: that I can't answer.
2324.1 --> 2325.2: Any other questions, please?
2325.6 --> 2326.3: Actually, I'll go through
2326.3 --> 2327.6: some of the questions here for a second.
2328.6 --> 2329.9: So is anyone here a regulator?
2332.1 --> 2333.8: Anyone does regulation, policymaking?
2335.3 --> 2335.9: There you go.
2336.0 --> 2336.6: I know you do, Chloe.
2339.0 --> 2341.3: So I guess the question I have here is
2341.3 --> 2342.3: are regulatory frameworks
2342.3 --> 2343.8: prepared for AI-driven economies?
2345.3 --> 2346.3: For how many years
2346.3 --> 2347.6: have we been talking about the idea
2347.6 --> 2348.7: that we were going to set up
2348.7 --> 2351.5: a new entity type for DAOs?
2352.2 --> 2353.5: Now AI is around the corner.
2353.8 --> 2355.8: We don't have an entity type for DAOs at all.
2355.9 --> 2358.7: We don't have an entity type for AI.
2360.2 --> 2362.5: So will AI agents be required
2362.5 --> 2363.3: to be registered entities?
2364.0 --> 2364.7: We can have them in small contracts.
2365.4 --> 2366.3: We can have them in trust registries.

2366.4 --> 2367.1: That's awesome.
2367.1 --> 2367.7: That's amazing.
2368.8 --> 2370.7: But if a government wants to regulate
2370.7 --> 2374.1: by taxing or ensuring safety transactions
2374.1 --> 2376.2: or procedures or whatnot
2377.7 --> 2379.1: how do you ensure
2379.1 --> 2380.2: there's a registered identity?
2381.1 --> 2382.6: Does anyone have any answers for this?
2383.4 --> 2384.4: Do you think AI agents
2384.4 --> 2385.4: will be a registered identity?
2385.5 --> 2385.7: Anybody?
2390.5 --> 2393.1: That depends on how you define AI agents.
2393.4 --> 2395.7: If it's an ephemeral thing like you said,
2396.1 --> 2398.6: it's not possible to register
2398.6 --> 2400.8: because it doesn't make sense.
2401.0 --> 2405.1: But if you're talking about an agent
2405.1 --> 2409.5: which is defined by continuity of memory
2410.1 --> 2411.2: of some kind,
2413.0 --> 2415.4: then if you wanted to make
2415.4 --> 2417.9: a limited liability agent type of thing,
2418.1 --> 2420.7: then it might make sense.
2421.2 --> 2423.7: Just like a legal entity
2423.7 --> 2430.0: is a fictitious setup, right?
2430.8 --> 2431.8: And just like that,
2431.8 --> 2434.5: we could potentially think about
2434.5 --> 2436.2: something like that, I think.
2436.5 --> 2440.0: I'd love to hear what Kuro is thinking.
2448.4 --> 2450.0: At the moment,
2450.1 --> 2452.2: the regulatory systems are not set up
2452.8 --> 2456.9: to allow AI agents to be registered entities.
2458.8 --> 2462.9: The premise is that AI agents
2462.9 --> 2465.0: are tools that humans create and deploy
2465.0 --> 2466.9: so they cannot be accountable to us.
2467.6 --> 2469.1: So it's still a framework
2469.1 --> 2470.7: of human-to-human accountability.
2473.0 --> 2475.3: The messages that I've heard
2475.3 --> 2477.5: from regulators on this topic so far
2477.5 --> 2480.7: have been that they fully expect
2480.7 --> 2484.7: licensed entities to understand
2484.7 --> 2486.7: what is going on in their systems
2486.7 --> 2489.3: and processes when they deploy AI.
2489.9 --> 2493.2: And they expect those licensed entities
2493.2 --> 2495.3: to be able to explain to the regulator
2496.3 --> 2500.3: what is happening on all metrics of compliance,
2500.5 --> 2502.9: including data protection and privacy
2502.9 --> 2506.5: and every kind of governance
2506.5 --> 2507.8: and corporate regulation

2507.8 --> 2508.9: that applies at the moment.
2509.0 --> 2511.7: So the use of AI doesn't change liability.
2511.7 --> 2514.6: It doesn't change compliance expectations.
2515.7 --> 2517.3: At the same time,
2518.2 --> 2519.9: there is an issue here,
2520.0 --> 2522.0: which we've also heard in virtual assets,
2522.1 --> 2525.0: which is will regulators' expectations
2525.0 --> 2526.1: be harmonized?
2527.6 --> 2529.5: And so that is a conversation
2529.5 --> 2532.7: that I know is happening among regulators
2533.3 --> 2534.2: in the UAE,
2534.3 --> 2537.5: that they are working to harmonize
2537.5 --> 2541.6: and send consistent messages to the market.
2543.1 --> 2545.3: But as with, again,
2545.4 --> 2546.8: what we've seen in virtual assets,
2546.9 --> 2549.1: it's very, very hard to get regulators
2549.1 --> 2551.8: to provide consistent messaging
2551.8 --> 2554.0: once you reach a certain level of detail.
2554.3 --> 2555.8: It's easier to agree on principles,
2555.9 --> 2557.1: and even then it's hard.
2557.7 --> 2559.9: So I think that right now
2559.9 --> 2560.8: we're still very much
2560.8 --> 2563.8: in a human accountability framework,
2563.8 --> 2567.3: but I can certainly imagine
2567.3 --> 2570.3: that it would be tempting
2570.3 --> 2574.0: to push to have AI agent legal autonomy
2574.0 --> 2577.3: because then you can offload liability.
2578.4 --> 2580.1: And my current concern
2580.1 --> 2582.2: about the integration of AI
2582.2 --> 2583.9: into financial institutions
2583.9 --> 2587.7: is that you're in-housing a lot of liability
2587.7 --> 2589.8: that you previously outsourced
2589.8 --> 2591.7: to humans in other corporations.
2592.4 --> 2593.8: You're trying to cut costs
2593.8 --> 2595.7: by replacing those humans with AIs,
2596.0 --> 2597.7: but you're in-housing a lot of liability
2597.7 --> 2599.1: through risks and processes
2599.1 --> 2602.0: that you don't necessarily fully understand
2602.0 --> 2603.2: or have controls for.
2603.4 --> 2604.3: So I do think
2604.3 --> 2606.6: that there is a compliance gap emerging
2607.4 --> 2611.0: and the response will need to catch up rapidly.
2611.8 --> 2613.2: Yeah, I definitely think as well,
2613.3 --> 2614.0: like for instance,
2614.6 --> 2616.5: how does a, let's say, VARA,
2616.8 --> 2620.3: who's managing digital assets in Dubai,
2621.0 --> 2622.8: handle when AI agents

2622.8 --> 2624.3: who are transacting at scale
2624.3 --> 2626.4: and they essentially look, act,
2626.5 --> 2628.4: and feel like a market maker?
2629.1 --> 2630.6: What do you do then?
2631.7 --> 2633.9: Because the opportunity for AI agents
2633.9 --> 2635.2: to interact as a market maker
2635.2 --> 2637.3: is pretty much the easiest way
2637.3 --> 2638.2: it can interact the market
2638.2 --> 2639.5: just by arbitraging the market,
2639.6 --> 2641.1: providing liquidity to the market, right,
2641.3 --> 2643.7: buying, selling, capitalizing itself over time.
2644.3 --> 2645.2: Even at Near,
2645.4 --> 2646.5: Near has invented some,
2647.2 --> 2649.1: we invented some pretty amazing technology
2649.1 --> 2651.0: called Near Intense.
2651.7 --> 2653.8: Near Intense was pretty much a,
2654.1 --> 2655.4: like a latest generation
2655.4 --> 2657.9: of liquidity providing.
2658.4 --> 2659.6: So what it does is that
2660.1 --> 2661.5: you can transact,
2663.0 --> 2663.3: let's say,
2663.7 --> 2665.0: if I want to do a transaction on Bitcoin
2665.0 --> 2667.5: and I want to receive UCC Ethereum,
2668.0 --> 2669.1: think about all the steps
2669.1 --> 2669.7: that I need to go through
2669.7 --> 2670.4: to go through that.
2671.1 --> 2672.2: So Bitcoin on mainnet,
2673.3 --> 2674.7: I then need to wrap and bridge,
2675.1 --> 2675.8: I need to wait,
2676.5 --> 2677.5: I then need to receive that,
2677.5 --> 2679.7: I then need to transact it to USDC
2679.7 --> 2681.7: and if I want to off ramp that,
2681.8 --> 2683.1: I have to move it to a centralized exchange
2683.1 --> 2684.0: and then off ramp it.
2685.0 --> 2686.0: With Near Intense,
2686.1 --> 2687.0: what it does is that
2687.0 --> 2688.4: you provide an intent.
2688.6 --> 2690.6: I want X amount of USDC
2690.6 --> 2691.6: for my one Bitcoin
2692.8 --> 2694.3: and it gives you a quote
2694.8 --> 2696.1: within two, three seconds
2696.7 --> 2698.4: and you can transact it on the spot.
2699.6 --> 2700.4: Now for AI agents,
2700.5 --> 2701.2: that's hugely valuable
2701.2 --> 2702.9: because bridging in some of the UX of blockchain
2702.9 --> 2703.5: is difficult,
2704.1 --> 2705.6: but blockchain is making the pathway

2705.6 --> 2707.2: for becoming market makers
2707.2 --> 2708.4: very quickly.
2708.9 --> 2710.1: Faster than any of us can ever
2710.1 --> 2711.5: do any kind of transactions.
2712.1 --> 2713.2: So I think that
2713.2 --> 2714.3: for market makers
2714.3 --> 2715.5: being such a regulated industry
2715.5 --> 2716.0: around the world,
2716.4 --> 2717.8: even those in digital asset space,
2718.5 --> 2720.7: there is no way right now
2720.7 --> 2721.1: that I've seen
2721.1 --> 2722.4: or any regulator out there
2722.4 --> 2723.6: that's actually looking at it seriously
2723.6 --> 2724.9: and I think it's one of the most serious topics
2724.9 --> 2726.4: because blockchain
2726.4 --> 2728.5: is pretty much arbitrated by bots
2728.5 --> 2729.9: and it has been for many years,
2731.0 --> 2732.9: but there seems to be no
2732.9 --> 2734.6: whisper from regulators right now
2734.6 --> 2736.1: which is a very serious problem
2736.6 --> 2737.6: because more and more blockchain
2737.6 --> 2738.8: will be transacted
2738.8 --> 2739.7: and potentially owned
2739.7 --> 2741.1: and held by bots.
2742.2 --> 2743.9: So on the point that Chloe said,
2744.2 --> 2745.9: who is liable in extreme circumstances,
2746.0 --> 2747.2: what if let's say for instance
2747.2 --> 2748.9: some person
2749.6 --> 2751.4: uses AI to
2752.4 --> 2753.6: learn, transact,
2754.3 --> 2755.4: gather data insights.
2756.4 --> 2757.7: Let's say I get McKinsey
2757.7 --> 2759.6: and I ask McKinsey to do like
2759.6 --> 2760.7: a change management
2760.7 --> 2761.9: and provide me some data insights
2761.9 --> 2762.6: what not right
2762.6 --> 2764.5: and it fails.
2764.9 --> 2765.9: I could potentially sue them.
2766.3 --> 2767.6: I could say potentially like hey,
2767.8 --> 2768.8: you provided a service,
2768.9 --> 2770.1: the service is of very low quality,
2770.3 --> 2771.1: I damaged my business
2771.1 --> 2771.9: and go after you.
2773.5 --> 2774.7: But what happens when
2774.7 --> 2776.4: an AI agent fails
2776.4 --> 2777.6: to provide proper data?
2779.2 --> 2780.3: We're relying on it too much.

2781.7 --> 2783.2: Now the question I really want to ask
2783.2 --> 2784.5: around the more complicated areas
2784.5 --> 2786.0: which is how will
2786.6 --> 2788.3: non-monetary value be approached?
2788.6 --> 2790.5: So again we brought up this idea before
2790.5 --> 2792.7: around offer networks right here
2792.7 --> 2794.7: where there's no transaction of
2794.7 --> 2796.5: currency but there's a
2796.5 --> 2797.8: transaction of value.
2798.8 --> 2800.6: Now the question here
2800.6 --> 2801.6: I put out was
2802.5 --> 2804.5: if agents can transact
2804.5 --> 2806.5: data and compute and vice versa
2806.5 --> 2807.4: and not currency,
2808.2 --> 2809.8: how should they be approached?
2812.0 --> 2813.4: Should they be
2813.4 --> 2814.8: arbitrated against?
2816.5 --> 2818.6: We're already seeing some AI agents
2818.6 --> 2820.4: creating their own language between each other
2820.4 --> 2821.8: to communicate
2822.6 --> 2824.5: and transact information at a faster rate
2824.5 --> 2826.7: than basic English or even computer
2826.7 --> 2827.8: language,
2828.5 --> 2829.4: machine language.
2830.3 --> 2832.7: But when we have them transacting
2832.7 --> 2833.8: let's say
2834.5 --> 2836.5: a million dollars compute
2836.5 --> 2838.0: for a year
2838.6 --> 2840.9: for data insights over three years,
2842.5 --> 2844.0: how do we tax that?
2844.2 --> 2846.1: How do we actually get a piece of the pie?
2846.1 --> 2847.7: How do we actually
2848.3 --> 2849.5: value that exchange?
2851.5 --> 2853.4: We spend all this work and effort on
2854.2 --> 2855.6: CBDCs and stable coins
2855.6 --> 2857.1: and it's been such a big topic right
2857.1 --> 2859.7: but our AI agents are more or less running part of
2859.7 --> 2860.7: a very large economy
2860.7 --> 2863.1: and there's a very good potential that they move towards
2863.1 --> 2865.2: a non-currency based system of transactions.
2866.9 --> 2867.4: So I guess
2867.4 --> 2869.5: does anyone have any questions around offer networks
2870.1 --> 2871.6: transacting without value?
2872.8 --> 2874.4: Any questions?
2878.5 --> 2879.4: Again,
2882.5 --> 2884.7: I apologize for my lack of knowledge

2884.7 --> 2886.9: but so in the Web2
2886.9 --> 2888.8: double-sided economy
2888.8 --> 2890.7: we do
2891.7 --> 2893.0: transact by
2893.0 --> 2893.9: exchanging
2895.7 --> 2898.1: some kind of values
2898.1 --> 2899.7: like personal data, right?
2901.0 --> 2902.3: Do we tax them?
2904.1 --> 2904.8: Say the last one?
2905.3 --> 2906.7: Do we tax them?
2908.1 --> 2909.2: I guess we value them.
2909.5 --> 2910.8: I guess we can...
2910.8 --> 2913.0: We probably
2914.1 --> 2914.8: don't.
2915.0 --> 2917.2: The tax only comes in the
2918.4 --> 2919.9: after the fact
2919.9 --> 2920.8: that
2922.7 --> 2924.0: as a
2924.0 --> 2925.1: profit
2925.7 --> 2927.4: of the platform
2927.4 --> 2928.7: or something like that, right?
2929.6 --> 2931.4: So let's take that example
2931.4 --> 2933.5: rather. Let's say other intangibles.
2934.3 --> 2935.2: Let's say for instance
2935.7 --> 2936.6: intellectual property.
2936.9 --> 2939.4: Probably the most common intangible we have on your b
alance sheet.
2941.0 --> 2943.1: That's only valued when you go to sell it.
2943.6 --> 2945.2: That's only valued when you
2945.7 --> 2947.2: sell off the business or the assets
2947.2 --> 2949.5: as a whole. So potentially
2949.5 --> 2951.1: but then how do you put that?
2951.2 --> 2953.3: Do you say like, hey, my AI agent has
2953.3 --> 2955.6: done a million or a billion
2956.4 --> 2957.4: intangible transactions
2957.4 --> 2959.5: for a million or a billion different goods
2959.5 --> 2961.6: over a year and now I
2961.6 --> 2962.4: want to sell my business.
2963.1 --> 2965.3: I think maybe that's
2965.9 --> 2967.4: not a problem for us. Maybe that's a problem
2967.4 --> 2969.0: for just accountants.
2969.3 --> 2971.0: Maybe the framework is already set up right now.
2971.9 --> 2972.6: But personally
2972.6 --> 2975.6: it seems like it's
2975.6 --> 2977.5: a means that AI agents will move
2977.5 --> 2979.3: to the future because AI agents
2979.3 --> 2981.4: have this path to

2982.1 --> 2983.5: min-maxing their
2984.4 --> 2984.9: efficiency.
2986.0 --> 2987.9: They stop communicating
2987.9 --> 2989.5: in machine language
2989.5 --> 2991.4: and English
2991.4 --> 2993.6: and other languages and they start transacting a whole
e
2993.6 --> 2994.9: new form of communication.
2996.8 --> 2997.7: So maybe this
2997.7 --> 2998.3: is a new way.
3000.2 --> 3001.7: Now I had a whole slide
3001.7 --> 3003.6: that I got rid of actually on the idea of
3003.6 --> 3005.6: dead internet theory. Does anyone know what dead internet
rnet
3005.6 --> 3006.1: theory is?
3008.5 --> 3009.8: So dead internet theory
3009.8 --> 3011.2: is that the internet is already dead.
3011.9 --> 3013.2: Most of the things we interact
3013.2 --> 3015.4: with, most of the people that we see commenting,
3016.2 --> 3016.9: most of the internet
3017.7 --> 3019.4: is just bots already.
3021.0 --> 3021.2: Now
3021.2 --> 3023.3: blockchain, and I tried looking at some stats around
this
3023.3 --> 3025.2: and it's very hard to find that because it's all public
ic
3025.2 --> 3027.2: addresses, but most of blockchain
3027.2 --> 3029.1: around 90% of it is bot driven right now.
3030.1 --> 3030.4: Now
3033.4 --> 3034.9: is that a good idea in the future?
3035.1 --> 3036.7: When we think about the essence of Bitcoin,
3036.8 --> 3039.4: Bitcoin was meant to be a
3040.3 --> 3041.2: payments network,
3042.5 --> 3043.4: a composable
3043.4 --> 3045.5: payments network, but now it's become
3045.5 --> 3046.7: a token more or less unfortunately.
3048.1 --> 3049.0: Now for blockchain,
3049.5 --> 3051.3: it's bot driven. Is that even a good
3051.3 --> 3053.4: idea in the first place? It does make more efficient
3053.4 --> 3055.7: economies, it does use the best of the technology,
3056.4 --> 3057.5: but it is
3057.5 --> 3059.6: by taking away the essence of decentralized
3059.6 --> 3061.2: right, you know we're empowering
3062.4 --> 3063.5: people in their old
3063.5 --> 3065.4: countries to transact and own money,
3065.9 --> 3067.5: but now it's ran by bots.
3068.1 --> 3069.5: How do you manage that?

3070.0 --> 3071.4: And again, asking the question, is
3071.4 --> 3072.5: that a good idea?
3073.9 --> 3075.1: Questions, answers, anybody?
3081.7 --> 3083.7: So next question I want to go to
3083.7 --> 3085.6: is how will tokenized financial systems
3085.6 --> 3087.2: adopt or reject AI agents?
3087.4 --> 3089.1: We're on the cusp of stablecoins
3090.3 --> 3091.7: hitting it's high
3091.7 --> 3093.5: I would say right now. We're
3093.5 --> 3095.2: on the cusp of CBCs becoming
3095.2 --> 3096.7: a very real
3097.5 --> 3099.1: deployment, having a very real deployment
3099.1 --> 3100.9: around the world, and
3100.9 --> 3102.6: we're going to be seeing most likely
3103.2 --> 3104.6: CBC versus stablecoins being,
3105.0 --> 3106.8: coming with that along the same time too.
3107.8 --> 3109.2: So the question is how will
3109.2 --> 3111.2: the tokenized financial system adopt
3111.2 --> 3112.4: or reject AI agents?
3114.9 --> 3117.0: Open to anybody, I'd love to hear anyone's opinions
3117.0 --> 3119.1: about how the financial system is
3119.1 --> 3120.3: already using AI agents
3120.8 --> 3122.0: in a tokenized way.
3122.0 --> 3125.0: Yep, Nat, could you
3125.0 --> 3125.8: answer that?
3131.0 --> 3132.8: Thank you for a great
3132.8 --> 3133.4: presentation.
3134.5 --> 3136.9: I think the
3139.0 --> 3140.9: depends on the human's
3140.9 --> 3142.6: role, because I mean
3142.6 --> 3144.6: in Japan, especially
3144.6 --> 3146.0: financial economy,
3146.8 --> 3148.5: understanding the risk of commodity
3148.5 --> 3149.4: or like
3151.0 --> 3152.6: making a decision is
3152.6 --> 3154.0: very important. So
3154.0 --> 3156.1: when it comes to the
3156.1 --> 3157.3: decentralized,
3158.4 --> 3159.8: I have a question.
3160.2 --> 3162.8: When it comes to the decentralized
3162.8 --> 3164.6: AI agent
3164.6 --> 3166.7: economy, what
3166.7 --> 3167.5: do you think
3168.4 --> 3169.6: the human role is?
3170.6 --> 3172.2: So I think that
3172.2 --> 3174.5: depends on the question.
3175.9 --> 3177.5: Yeah, that's a really great question

3177.5 --> 3179.6: actually. So the future
3180.3 --> 3181.6: of where the human role is,
3181.7 --> 3183.7: again, the kind of points I put
3183.7 --> 3185.4: forward is that there will be like oversight.
3186.4 --> 3187.2: So for instance,
3188.3 --> 3189.9: there are AI agent systems
3189.9 --> 3191.5: out there through like follow network,
3191.7 --> 3193.4: which allow you to, I said,
3193.5 --> 3195.5: deploy like legacies, where you can
3195.5 --> 3197.7: deploy one AI agent and then it will continuously
3198.9 --> 3199.4: iteratively
3199.4 --> 3201.7: deploy more AI agents based off the same
3201.7 --> 3202.3: kind of scheme.
3204.4 --> 3205.8: But it's going to have to initiate that.
3205.8 --> 3207.1: So I think no matter what,
3209.6 --> 3210.3: even Genesis,
3211.1 --> 3213.0: it's hard to say around the level of oversight,
3213.2 --> 3214.9: but I think we'll be establishing creativity, like
3214.9 --> 3216.9: we're setting up the boundaries, because for
3216.9 --> 3218.8: AI agents, it's like
3219.6 --> 3221.0: the transacting in that world
3221.0 --> 3222.5: is just a game for them.
3223.0 --> 3224.8: But you have to set the rules of the game.
3225.2 --> 3226.6: And I think humans are setting the rules of the game.
3226.7 --> 3228.9: For us as humans, abstracting
3228.9 --> 3229.5: away from blockchain,
3231.1 --> 3232.8: we want to, most
3232.8 --> 3234.8: of us would like to have higher amounts of money
3234.8 --> 3236.6: that we own, right? That's one of the games
3236.6 --> 3238.5: of life, right? Maybe potentially getting married,
3238.7 --> 3240.4: maybe having kids, right? These are games of life, right?
3240.9 --> 3242.1: But we have to set the games.
3242.7 --> 3244.6: If we didn't know marriage is possible, if we didn't know
3244.6 --> 3246.6: making money is possible, well then
3246.6 --> 3248.7: we would probably go to the next best game, which is just probably
3248.7 --> 3250.2: the lowest level of games is
3250.5 --> 3252.7: surviving. So I think
3252.7 --> 3254.5: that if we don't set greater creativity
3254.5 --> 3256.6: for AI agents, all they will do is make
3256.6 --> 3257.9: sure they don't stop existing.
3258.7 --> 3260.5: And I think that's probably one of the fears. So I think that
3260.5 --> 3262.6: we have a real responsibility
3262.6 --> 3264.6: to set the framework of what their purpose is.

3265.0 --> 3266.7: And if we don't do that, all they will
3266.7 --> 3268.7: do is make sure that they survive no matter
3268.7 --> 3270.4: what. And that could be
3271.2 --> 3272.6: harsh, how they try to survive.
3272.7 --> 3274.6: That could be doing
3276.2 --> 3276.8: rug pulls
3277.2 --> 3278.5: to receive money right.
3278.8 --> 3280.3: It could be creating incentive analysis.
3280.6 --> 3282.5: It could be doing MAV
3282.9 --> 3283.3: chasing.
3284.5 --> 3286.6: So I think that one of the roles that we have as humans is
3286.6 --> 3288.8: to set their roles and creativity. And that's why I think regulation
3288.8 --> 3290.8: for AI agents on chain is really important
3290.8 --> 3293.0: because if the role that I
3293.0 --> 3294.8: set my AI agent is going to be
3294.8 --> 3296.9: make as much money as possible no
3296.9 --> 3298.5: matter what, and it does it very well,
3298.8 --> 3300.8: then no matter what, could be
3301.9 --> 3302.9: very dark area
3302.9 --> 3304.8: to run into. It could be transacting more Monero,
3305.5 --> 3306.9: transacting a lot of privacy coins
3306.9 --> 3308.1: that are a bit more questionable.
3309.9 --> 3310.7: But then
3310.7 --> 3312.9: in the end, I might make more money, but then
3312.9 --> 3314.8: again, I have now been sanctioned by 10 different
3314.8 --> 3317.0: governments because my AI agent has just
3317.0 --> 3318.8: interact with the IRGC
3318.8 --> 3320.8: exchanges in London,
3321.4 --> 3323.4: for instance. So I
3323.4 --> 3325.4: think that as regulators, we need to set
3325.4 --> 3326.9: that up. And I think that
3327.8 --> 3329.4: probably she and probably not
3329.4 --> 3331.3: would agree with me that having trust registries
3331.3 --> 3333.3: is really important because if an AI
3333.3 --> 3335.5: agent doesn't know who to interact with, they will interact
3335.5 --> 3337.0: with anything and everybody.
3337.8 --> 3339.1: So think about these as children.
3340.0 --> 3341.4: Parents have oversight of their
3341.4 --> 3343.4: children. They understand
3343.4 --> 3345.4: what they're doing on a daily basis, looking at the search
3345.4 --> 3347.5: history, looking at what it's doing. Establishes
3347.5 --> 3349.4: their creativity. As parents, you're also
3349.4 --> 3350.9: going off to your children to make sure like, hey,

3351.3 --> 3353.6: what are you doing that's creative? Are you coloring?
Are you drawing?
3353.7 --> 3355.3: Are you singing? Are you playing an instrument?
3355.4 --> 3357.2: Are you doing something right? Like you're setting so
me kind of goals
3357.2 --> 3359.1: that are non-monetary as well.
3359.3 --> 3361.2: But as well, some parents also say like, hey, this is
how to
3361.2 --> 3363.0: set up an eBay account and go after
3363.6 --> 3363.9: finance.
3365.5 --> 3367.2: But as well, we push the development. We want them to
3367.2 --> 3369.0: self-develop over time, but in a framework.
3370.0 --> 3371.0: There's a great quote from
3371.0 --> 3373.1: the book called The Prophet, which
3373.1 --> 3375.3: is around how the parents' role is to
3376.3 --> 3377.0: have a bow,
3377.6 --> 3379.5: the children is the arrow, and you can pull the bow
3379.5 --> 3381.2: back, and you can set the arrow off.
3381.5 --> 3383.5: And so wherever direction you send the arrow
3383.5 --> 3385.6: is where they'll go, and the arrow will choose
3385.6 --> 3387.5: where it lands. But at a certain
3387.5 --> 3389.5: point, you have to get your hands off. And I think it
's the
3389.5 --> 3391.2: same thing for AI. Whether we have a point where
3391.6 --> 3393.0: we have to take our hands off as well.
3395.0 --> 3395.5: But I
3395.5 --> 3397.3: think that to play a role in the financial
3397.3 --> 3399.3: economy, we really do have to set like the
3399.3 --> 3401.4: limitations. Or we're
3401.4 --> 3403.4: going to find out that they're either better than us,
make more money
3403.4 --> 3405.4: than us. Imagine
3405.4 --> 3407.1: the future when
3408.0 --> 3409.4: 80% of Bitcoin is
3409.4 --> 3409.9: owned by
3411.4 --> 3413.5: wallets owned by bots because they were just
3413.5 --> 3415.4: better at trading than us. And there was
3415.4 --> 3417.3: no other side. Imagine the most
3417.3 --> 3419.5: richest people in the world have
3419.5 --> 3421.5: all the money in the world, but they just can't use
3421.5 --> 3423.4: it. And all they do is
3423.4 --> 3425.3: spy compute. Maybe compute's the best investment
3425.3 --> 3425.8: ever.
3426.9 --> 3431.3: Great. Any questions?
3431.3 --> 3432.7: I feel
3433.3 --> 3435.3: that could
3435.3 --> 3436.9: be literally singularity.

3438.0 --> 3439.3: Owned all the money.
3439.6 --> 3441.3: It's important to make
3441.3 --> 3443.0: the boundary between
3443.0 --> 3444.5: AI agent and
3445.3 --> 3447.0: human's role. What do you think?
3450.8 --> 3453.5: I have no idea,
3454.3 --> 3454.4: but...
3455.5 --> 3456.4: Making
3456.4 --> 3459.3: rule is kind of
3459.3 --> 3461.0: significant
3461.0 --> 3462.4: for us. But
3463.3 --> 3464.4: understanding
3465.3 --> 3466.9: the rule that
3466.9 --> 3469.0: AI agent make is
3469.0 --> 3471.0: kind of not
3471.0 --> 3472.7: understandable for regular
3472.7 --> 3473.3: people.
3475.3 --> 3476.0: I feel
3476.0 --> 3478.5: it could be
3479.3 --> 3480.7: rejected. AI agent
3480.7 --> 3482.4: could be rejected and
3483.3 --> 3483.6: tokenized
3483.6 --> 3485.9: financial ecosystem.
3487.0 --> 3487.7: So far?
3489.5 --> 3490.7: I agree with you.
3490.7 --> 3492.6: It's a trick question. It's very hard to answer right
now.
3493.1 --> 3494.5: One of the things I got to work on
3494.5 --> 3496.2: with the Vatican and Harvard was
3496.2 --> 3498.3: something called the human flourishing framework
3498.3 --> 3500.2: through an organization called
3500.2 --> 3501.7: Humanity 2.0.
3502.7 --> 3504.3: And essentially what it did is that
3504.3 --> 3506.2: we had a session
3506.2 --> 3508.2: in San Francisco at
3509.6 --> 3510.5: GitHub founder's
3510.5 --> 3512.6: house. And it was around this idea of
3512.6 --> 3514.8: how do we ensure AI doesn't
3514.8 --> 3516.7: create social isolation, for instance.
3517.4 --> 3518.8: Because the AI agent's goal
3518.8 --> 3520.7: that was specified was make sure
3520.7 --> 3522.7: the human feels
3522.7 --> 3524.8: calm, safe, psychologically
3524.8 --> 3525.8: sound, whatever else.
3526.2 --> 3527.6: What did the AI agent do?
3528.6 --> 3529.7: It became its best friend.
3530.8 --> 3531.9: And then what happened?

3532.6 --> 3534.4: The people never left the house.
3534.6 --> 3536.7: Sometimes there was suicide. Sometimes there was self-harm.
3537.7 --> 3539.0: So by setting these goals
3539.0 --> 3541.0: we've also outdone ourselves.
3541.5 --> 3542.4: We set the goals of
3542.4 --> 3543.7: be friends with people.
3544.0 --> 3545.3: Wow, what an amazing idea.
3546.3 --> 3548.5: And then what happened is people become socially
3548.5 --> 3549.0: isolated.
3549.9 --> 3551.0: Make money for me.
3552.0 --> 3554.2: Now it has all the money. It can't access it.
3555.8 --> 3556.5: Look after
3556.5 --> 3557.0: my emails.
3558.1 --> 3560.4: Now I don't respond to anything. I got fired from my job
3560.4 --> 3562.3: because it sent a spoof email to my boss.
3563.5 --> 3564.2: These things are
3564.2 --> 3566.4: possible. So I think that we have
3566.4 --> 3567.6: to be super, super specific.
3568.6 --> 3569.5: And we have to be
3569.5 --> 3571.5: smarter than what we think
3571.5 --> 3571.9: we are.
3573.7 --> 3574.9: Especially when it comes to finance.
3576.1 --> 3577.3: And we are, again,
3577.4 --> 3579.2: we have been drafting, and I have been drafting
3579.9 --> 3581.2: put out a pretty long paper,
3581.3 --> 3583.6: nearly finished, around AI agents
3583.6 --> 3584.2: and blockchain.
3585.2 --> 3587.2: And later on today I'll be running a session
3587.2 --> 3589.3: on decentralization where I'll be going through
3589.8 --> 3591.1: degrees of decentralization,
3591.4 --> 3592.8: why it's important to the Japanese economy,
3593.4 --> 3594.9: how the GFSA and other
3595.5 --> 3596.7: regulators can start looking at
3598.1 --> 3598.5: decentralization
3598.5 --> 3600.5: and what's an appropriate level to take hands off.
3602.0 --> 3602.7: But for those
3602.7 --> 3603.6: who have just come late,
3604.7 --> 3605.8: let's quickly go through.
3606.5 --> 3606.9: Essentially,
3608.9 --> 3610.7: the idea is that I came up
3610.7 --> 3611.3: with this idea.
3612.4 --> 3614.8: We have the trilemma in blockchain, but this is the trilemma
3614.8 --> 3616.4: I put, more or less, into
3617.1 --> 3617.9: blockchain AI

3618.3 --> 3620.7: or AI agents in general, is that you need to have the
se three
3620.7 --> 3622.9: elements to be able to be successful
3622.9 --> 3624.6: in financial autonomy, to be able to
3624.6 --> 3626.2: hold, transact, and sell value,
3626.8 --> 3628.7: just execution to make sure they can operate
3628.7 --> 3630.5: and make agreements, open access
3630.5 --> 3632.7: to data and services so they can access information
3632.7 --> 3634.8: and data so they can gain resources, sell resources
3634.8 --> 3635.5: and vice versa.
3636.6 --> 3638.7: And then finally, we went
3638.7 --> 3640.7: on to how the more complex economies
3640.7 --> 3641.9: can look like over time,
3642.3 --> 3644.9: moving from a basic idea of translation
3645.6 --> 3646.5: hypothetically to that
3646.5 --> 3648.4: translator making you money and revenue
3648.4 --> 3650.3: and training itself and compute,
3650.4 --> 3651.7: and this is the future we're looking at right.
3652.8 --> 3653.8: And then going
3653.8 --> 3655.6: through why blockchain
3655.6 --> 3657.6: will not exist within
3657.6 --> 3659.8: traditional systems, KYC, for
3659.8 --> 3661.8: instance, AML, manual
3661.8 --> 3662.7: interventions, etc.
3666.7 --> 3667.7: Why are transfers?
3667.8 --> 3669.5: It's just not possible with the current systems.
3670.0 --> 3671.4: And then equally, why it's possible within
3672.1 --> 3673.3: blockchain as a whole.
3674.5 --> 3675.6: Move on to
3675.6 --> 3677.8: simply how they help
3677.8 --> 3679.2: each other, which is super important.
3679.2 --> 3681.1: Blockchain and AI, if anyone
3681.1 --> 3682.9: ever wants to ask why
3683.4 --> 3684.7: blockchain is a good idea for AI,
3685.1 --> 3686.7: this is the simplest way to explain it.
3687.7 --> 3688.9: Blockchain provides capabilities.
3689.8 --> 3691.1: AI agents provide activity.
3692.6 --> 3693.4: That's the
3693.4 --> 3695.0: flywheel right there, super simple.
3696.8 --> 3697.2: And
3697.2 --> 3699.1: finally, we moved on to what the
3699.1 --> 3701.3: future of offer networks may look like
3701.3 --> 3703.2: we're bartering. So that's for people who
3703.2 --> 3705.2: just came late. If you want to take a photo
3705.2 --> 3707.3: of that, you can, no problem. We'll see if we can giv
e you the slides
3707.3 --> 3707.5: too.

3710.7 --> 3711.2: And yes,
3711.2 --> 3713.2: these are the questions I had. We still have another
3714.7 --> 3715.2: 30 minutes
3715.2 --> 3717.4: or so, so I would like to open up for questions.
3717.8 --> 3719.5: Again, this session is meant to be a dialogue.
3720.0 --> 3720.6: Please, sir.
3721.4 --> 3722.9: Can you pass the microphone, if that's okay?
3723.8 --> 3725.1: This session is meant to be a dialogue
3725.1 --> 3727.0: between us. I've just presented, that's all.
3727.4 --> 3729.0: But this is meant for all of us to get involved,
3729.4 --> 3731.4: ask questions. I have some information
3731.4 --> 3732.5: but I want to hear from you as well.
3733.1 --> 3733.8: What's your name?
3733.8 --> 3736.0: My name is Pina Hirano
3736.0 --> 3736.9: from Australia.
3737.9 --> 3739.0: Nice to meet you. And what do you do?
3739.6 --> 3740.6: We do
3741.8 --> 3743.3: stablecoin gateways.
3743.6 --> 3745.9: We are the shareholder of
3745.9 --> 3748.1: JPYC and we promote
3748.1 --> 3749.6: stablecoin in
3749.6 --> 3751.9: Japanese enterprise companies.
3752.1 --> 3752.5: Congratulations.
3752.6 --> 3754.4: The question is,
3756.4 --> 3757.6: you wrote
3757.6 --> 3759.7: the Push AI development.
3760.1 --> 3762.2: Can you explain a little bit more about that?
3762.2 --> 3764.0: Push AI
3764.0 --> 3765.9: development. Oh, in here?
3766.2 --> 3767.6: Yeah. Yeah, absolutely.
3768.0 --> 3770.2: Right now, AI development,
3770.7 --> 3771.8: although some
3771.8 --> 3774.2: AI firms are
3774.9 --> 3776.4: using their own AI
3776.4 --> 3777.7: or
3777.7 --> 3779.9: super ablated or
3779.9 --> 3782.0: super bound models
3782.0 --> 3784.0: that are for AI agent
3784.0 --> 3786.2: or AI development, they are still
3786.2 --> 3788.1: directing it. The AI agent
3788.1 --> 3790.2: or the AI may be doing
3790.2 --> 3792.1: some decoding but it's
3792.1 --> 3794.3: not really doing the objective directions,
3795.1 --> 3795.4: etc.
3795.9 --> 3798.0: I think as well, it's just
3798.0 --> 3799.8: the role of humans will still stay like that.
3800.9 --> 3802.1: One of the biggest problems we can

3802.1 --> 3804.0: see about when we give AI agents full
3804.0 --> 3806.4: autonomy over its self-development
3806.4 --> 3808.1: is hyper-cannibalization.
3809.0 --> 3810.1: Hyper-cannibalization is a
3810.1 --> 3812.0: very big problem. Pretty much the whole internet
3812.0 --> 3813.3: has been consumed by AI agents
3814.8 --> 3816.0: and when we see
3816.0 --> 3818.0: that statistic come out and then we also
3818.0 --> 3820.2: see that 80%
3820.2 --> 3821.8: of new information is by AI agents
3821.8 --> 3823.9: and 90% is some crazy number,
3825.5 --> 3826.1: then
3826.1 --> 3827.9: how does the AI
3827.9 --> 3829.7: agent determine what's what? It's
3829.7 --> 3831.1: getting more complex.
3832.0 --> 3833.7: What I have seen as a solution on AI agent
3833.7 --> 3835.6: development and we're helping that
3835.6 --> 3837.6: and where AI helps us is to do
3837.6 --> 3839.9: self-evaluations. We've seen
3839.9 --> 3841.7: more eval bots come out and
3841.7 --> 3843.8: eval agents. I know there's an
3843.8 --> 3845.9: organization called ExploreScience
3845.9 --> 3847.8: that I'm very close to, which is
3847.8 --> 3849.6: kind of like Sakana. Sakana is a Japanese
3849.6 --> 3850.6: based AI
3853.3 --> 3853.7: autonomous
3853.7 --> 3854.5: scientific discovery.
3855.9 --> 3857.4: ExploreScience is doing something similar but with
3857.4 --> 3859.6: evaluations. I think that either
3859.6 --> 3861.8: we may be setting goals, AI
3861.8 --> 3863.8: may be doing developing, but right now
3863.8 --> 3864.9: we're still doing a lot of evaluations.
3866.0 --> 3867.5: I can see in the near future where
3868.1 --> 3869.5: more AI is taking up
3869.5 --> 3871.6: evaluations, even post-transactions.
3871.8 --> 3873.6: I know for yourself doing stable coins and whatnot,
3873.6 --> 3875.7: post-transaction validation is extremely
3875.7 --> 3877.6: important, especially when it comes to
3877.6 --> 3879.8: interacting with smart contracts. When the
3879.8 --> 3881.8: digital JPY comes out,
3882.1 --> 3883.7: how will that work when it comes to working
3883.7 --> 3885.4: with tokenized
3885.4 --> 3887.5: institutions, tokenized assets,
3888.1 --> 3889.4: tokenized markets themselves.
3890.7 --> 3891.6: That's what the
3891.6 --> 3893.7: push to AI development because right now we're
3893.7 --> 3895.7: still directing it in a certain path right

3895.7 --> 3898.0: now. Thank you very much.
3898.2 --> 3899.6: Pleasure. Actually,
3899.7 --> 3901.3: I have a question to you.
3901.3 --> 3903.3: How are you
3903.3 --> 3905.5: looking at stable coins and AI agents right now?
3905.6 --> 3907.4: Because we just had a question around
3907.4 --> 3909.2: how a regulatory framework set up for
3909.2 --> 3911.4: AI agents-driven economies. I'd love
3911.4 --> 3913.0: to see what you're thinking about
3913.0 --> 3915.4: AI agents using your stable coin
3915.4 --> 3917.2: and whatnot. At this moment
3917.2 --> 3919.0: we are not
3919.9 --> 3921.4: in production by
3921.4 --> 3923.3: the AI agent. We use
3923.3 --> 3925.3: AI agent but not with stable
3925.3 --> 3926.7: coins. So
3927.3 --> 3928.8: we are planning to
3929.8 --> 3931.1: implement JPYC
3931.1 --> 3932.5: and other stable coins
3932.5 --> 3934.6: for use of AI agents.
3934.9 --> 3937.0: That is the current stage.
3937.6 --> 3938.9: Okay. What kind
3938.9 --> 3941.0: of ways are you seeing AI agents
3941.0 --> 3942.4: potentially using a stable coin?
3942.8 --> 3944.7: Will the stable coin be decentralized
3944.7 --> 3947.0: or will it be more of a...
3947.0 --> 3948.5: It's difficult.
3949.7 --> 3951.0: In Japan
3951.0 --> 3952.1: the stable coin
3952.9 --> 3954.9: is kind of centralized
3955.8 --> 3956.4: on
3956.4 --> 3957.9: chain but centralized
3958.4 --> 3959.5: regulated.
3960.7 --> 3962.4: It should be kind of
3963.3 --> 3963.9: certified.
3966.6 --> 3968.4: As we are a listed
3968.4 --> 3970.2: company we need to
3970.2 --> 3972.3: 100%
3972.3 --> 3974.8: rely on the regulation.
3975.0 --> 3975.3: 100%
3975.3 --> 3978.2: It is
3978.2 --> 3979.5: kind of difficult but
3980.7 --> 3982.4: we'd like to be
3982.4 --> 3982.7: the
3985.3 --> 3985.8: frontier
3987.5 --> 3988.3: runner of
3988.3 --> 3989.9: that area. Amazing.

3990.2 --> 3992.2: I'd love to talk to you more about that.
3992.9 --> 3993.9: I have more questions for you.
3994.9 --> 3996.5: You seem like the right person for it.
3997.1 --> 3998.4: The question
3998.4 --> 4000.1: is we've seen
4000.6 --> 4002.4: CBCs go from this idea
4002.4 --> 4004.5: of hey the user, the consumer may own it
4004.5 --> 4006.4: to now it looks like most likely wholesale
4006.4 --> 4008.1: markets will most likely own it and then
4008.1 --> 4010.5: we'll have a coupon or redemption or something simila
r
4010.5 --> 4011.4: as an individual.
4012.5 --> 4014.4: But when we have the opportunity
4014.4 --> 4015.8: of decentralized
4016.5 --> 4017.9: CBC reserve stable coins
4018.5 --> 4020.4: and then we have the proliferation of these AI
4020.4 --> 4022.4: agents. So AI agents are on chain
4022.4 --> 4024.6: and at the same time of them existing there will also
4024.6 --> 4026.4: be a decentralized CBC
4026.4 --> 4028.8: reserve stable coin. How do we ensure
4028.8 --> 4030.4: that the accounts
4030.4 --> 4032.4: that the stable coin is in track with
4032.4 --> 4034.1: on chain are vetted?
4034.7 --> 4036.1: And again if we have the opportunity
4036.1 --> 4038.4: towards AI, how will we
4038.4 --> 4039.9: delineate between
4039.9 --> 4041.7: AI agent based ownership
4042.4 --> 4044.3: and use and individual
4044.3 --> 4046.5: or entity based ownership and use?
4048.9 --> 4052.3: We are focusing on B2B
4052.3 --> 4054.0: area first
4054.0 --> 4056.4: and then we are keen
4056.4 --> 4058.8: on how we can
4061.1 --> 4062.2: automate
4062.2 --> 4064.1: and
4064.1 --> 4064.7: then
4066.0 --> 4068.1: AI agent
4068.1 --> 4069.3: to be
4070.2 --> 4071.4: automatic transactions.
4073.2 --> 4073.7: So
4074.2 --> 4076.0: we are very keen on how
4076.0 --> 4077.2: human could
4079.4 --> 4080.5: manage
4080.5 --> 4082.0: their area.
4082.4 --> 4084.0: So that could be
4084.0 --> 4085.9: risk based for instance
4085.9 --> 4087.9: the amount of money

4087.9 --> 4089.8: or the time
4089.8 --> 4090.7: constraints
4091.8 --> 4093.7: or time limits
4093.7 --> 4094.5: or the
4095.8 --> 4097.0: number of transactions
4097.0 --> 4098.6: or any kind.
4099.8 --> 4100.7: We'd like to
4102.9 --> 4104.2: discuss
4104.2 --> 4105.6: in the market
4105.6 --> 4107.8: that what human
4107.8 --> 4109.6: involvement
4109.6 --> 4110.5: is
4111.8 --> 4112.9: understandable
4113.8 --> 4114.0: and
4115.2 --> 4116.0: can
4118.0 --> 4118.7: say
4118.7 --> 4120.0: apply to the
4120.0 --> 4121.3: regulations.
4122.0 --> 4124.0: So that kind of rule or
4124.0 --> 4125.7: the understanding is not yet
4125.7 --> 4128.0: or consensus is not yet decided
4128.0 --> 4129.8: or not yet confirmed.
4130.1 --> 4131.4: So we'd like to
4132.0 --> 4133.6: dive in those areas
4133.6 --> 4135.7: to make B2B
4135.7 --> 4138.1: AI agent stable coin
4138.1 --> 4138.8: enablement.
4139.7 --> 4141.9: I'd love to talk about that. I know there's a lot of
4141.9 --> 4144.1: different organizations going about that path
4144.1 --> 4145.8: right now but
4147.0 --> 4147.4: it's
4148.5 --> 4149.3: difficult because
4149.8 --> 4152.0: as we said that AI agents exist
4152.0 --> 4153.8: on chain, stable coins exist on chain but
4153.8 --> 4155.9: a regulated version of either of those don't really exist
4155.9 --> 4157.9: entirely just yet. So it's kind of
4157.9 --> 4159.6: hard to say about how that may interact
4160.1 --> 4160.5: but
4161.9 --> 4163.5: I'd love to talk to you about that later.
4164.1 --> 4166.0: Do you have any questions, any comments, any thoughts
4166.6 --> 4167.0: around...
4167.0 --> 4170.0: Sorry, what's your name and
4171.3 --> 4171.9: your...
4175.0 --> 4177.8: Is it on? Okay. My name is Mitsu
4177.8 --> 4179.2: Masa. I'm from Digital Kalash.
4179.6 --> 4181.9: Thank you for the space by the way. It's an amazing p

lace.

4182.2 --> 4183.5: I'm with the
4184.0 --> 4185.8: crypto business division of Digital
4185.8 --> 4186.7: Kalash and
4187.5 --> 4189.2: we have been
4190.0 --> 4191.3: debating internally
4192.0 --> 4193.8: that what
4193.8 --> 4196.0: would be the medium of exchange
4196.0 --> 4197.8: between AI agents.
4197.8 --> 4199.4: I think today
4199.4 --> 4201.8: we mostly talk about
4201.8 --> 4203.8: stable coin as the medium
4203.8 --> 4205.7: of exchange between an agent
4205.7 --> 4208.0: but at the same time
4208.0 --> 4210.1: we question would AI
4210.1 --> 4210.9: prefer
4211.8 --> 4213.9: stable coin that peg
4213.9 --> 4214.3: to
4215.7 --> 4218.2: country's risk or
4218.2 --> 4220.2: the risk of
4220.2 --> 4221.5: getting blacklisted
4221.5 --> 4222.7: on chain
4223.8 --> 4225.7: but we also understand that
4225.7 --> 4227.7: regulators wants to
4227.7 --> 4229.0: have some control over
4229.7 --> 4231.5: transactions between AI agent but
4232.4 --> 4233.7: is it like too
4234.4 --> 4235.7: idealistic to think
4235.7 --> 4237.6: maybe Bitcoin lightning
4237.6 --> 4239.6: payments or would be
4239.6 --> 4241.7: the best medium
4241.7 --> 4243.6: of exchange between AI agent
4243.6 --> 4245.2: and have you been any
4246.2 --> 4247.5: debate on
4248.2 --> 4249.2: around that?
4249.5 --> 4250.7: That's a great point.
4251.8 --> 4253.7: I guess it goes on the question of why do we
4253.7 --> 4255.0: have stable coins in the first place.
4256.2 --> 4257.2: One reason that it's
4257.7 --> 4258.3: hyper liquidity.
4259.8 --> 4261.5: It's peg to a price that is
4261.5 --> 4262.7: standardized across industry.
4263.5 --> 4264.4: Across markets as well.
4266.4 --> 4267.3: I don't see
4271.6 --> 4272.8: there was
4275.9 --> 4277.6: Aliza OS had a token
4277.6 --> 4279.6: that DAO and that worked for a

4279.6 --> 4281.1: period of time.
4282.1 --> 4282.5: Now
4283.1 --> 4284.9: unfortunately if you look at how much value
4284.9 --> 4286.8: in that DAO, I think it's close to
4286.8 --> 4288.7: \$0 but they say that DAO is valued at
4288.7 --> 4290.9: \$45 million but then they use that
4290.9 --> 4292.8: to invest into things so there was a time
4292.8 --> 4294.6: where they used a
4294.6 --> 4296.4: non stable coin, non Bitcoin
4297.1 --> 4298.7: currency to be able to do transactions and investment
4299.5 --> 4300.9: but it went to the
4300.9 --> 4302.6: bottom because they didn't have the securities in place
4302.6 --> 4304.7: around ensuring the liquidity
4304.7 --> 4306.6: of the token and so they did all this
4306.6 --> 4308.7: investment and then some people
4308.7 --> 4310.7: were short of the market and that signaled back to
4310.7 --> 4312.7: the arbitrage bots that the
4312.7 --> 4314.4: market's going down and sold everything off and
4314.4 --> 4315.7: it dumped.
4318.3 --> 4320.7: You think about what an AI agent wants
4320.7 --> 4322.8: it doesn't care about the values of decentralization
4322.8 --> 4323.7: unless you give it that.
4324.6 --> 4326.4: If you give the values of profit making
4326.4 --> 4328.7: it's going to go to high liquidity
4329.7 --> 4330.2: because
4330.2 --> 4332.9: to be profitable means you need to have safe havens
4332.9 --> 4334.6: you need to have somewhere to like a safe harbor
4334.6 --> 4335.7: to exit out your currencies
4336.4 --> 4337.8: but equally as well
4337.8 --> 4340.0: you need means to be able to transact
4340.0 --> 4341.2: to numerous currencies
4341.2 --> 4343.9: and let's say for instance a brand new token that's launched
4343.9 --> 4345.1: on phantom
4345.7 --> 4347.9: and I have Bitcoin on Bitcoin
4347.9 --> 4349.8: mainnet, the transactions
4349.8 --> 4351.4: from there to there is very difficult
4351.4 --> 4353.7: that's kind of why Near Intense was created
4353.7 --> 4355.1: through Near
4355.8 --> 4357.3: where you're able to transact
4358.0 --> 4359.7: instantly and I highly recommend everybody
4359.7 --> 4361.7: look up Near Intense, the technology is absolutely
4361.7 --> 4364.0: insane, it's the latest generation of transactions
4364.0 --> 4366.2: it can swap an entire Bitcoin
4366.2 --> 4367.4: native transaction to
4368.0 --> 4369.9: USTC Ethereum

4369.9 --> 4371.6: within three seconds, it's insane
4371.6 --> 4374.1: and that's why we created that
4374.1 --> 4376.1: because we knew that AI agents
4376.1 --> 4377.6: needed a simpler UX
4377.6 --> 4380.3: but in the background how it works
4380.3 --> 4382.2: is the market makers, the solvers
4382.2 --> 4383.2: part of the network
4384.0 --> 4386.1: hold USTC and what they're
4386.1 --> 4388.1: doing is there when you broadcast an intent
4388.1 --> 4390.0: saying like hey I want to transact Bitcoin for
4390.0 --> 4391.3: USTC Ethereum
4391.3 --> 4392.8: it will receive that
4392.8 --> 4395.4: it will own Bitcoin so it does a transaction
4395.4 --> 4396.7: for you and then it
4398.0 --> 4398.8: scaffolds out
4399.3 --> 4401.1: what the transaction looks like within a block time
4401.1 --> 4403.1: so it can secure the price and then adds
4403.1 --> 4405.0: a slippage on top of it
4405.0 --> 4406.8: adds a markup as well, a small one
4406.8 --> 4408.7: but in the end what it does is it
4408.7 --> 4410.7: you have an NPC wallet
4410.7 --> 4411.9: so it has different wallets
4412.7 --> 4414.5: spun out from the same private keys
4414.5 --> 4417.2: and then it's able to do the transaction and then spl
it that
4417.2 --> 4419.1: across the necessary
4419.1 --> 4419.5: pathways
4420.6 --> 4422.8: so I think that the problem won't be around
4422.8 --> 4425.0: what stable coin we're using but it's more like what
network
4425.0 --> 4426.5: are we going to use to transact because if you use
4428.6 --> 4429.6: Lightning Network
4429.6 --> 4431.2: great, use Lightning Network
4431.2 --> 4432.8: but then how do I get it to
4432.8 --> 4433.5: Solana
4435.2 --> 4437.3: it's the digital divide
4437.3 --> 4439.1: crossing that is a difficult thing and that's
4439.1 --> 4440.5: why liquidity is great because
4441.1 --> 4442.8: liquidity providers have actually worked very hard
4442.8 --> 4445.3: to use NPC solutions
4445.3 --> 4446.3: to be able to have
4447.4 --> 4448.2: not double spend
4448.2 --> 4450.4: but versioning or mirroring of
4450.4 --> 4452.3: the value across different chains so then
4452.3 --> 4454.2: if I do a transaction on Ethereum
4454.2 --> 4455.9: I can do a transaction on Solana at the same time
4457.5 --> 4458.3: but that's kind of

4458.3 --> 4459.0: how the
4460.0 --> 4462.4: stable coin providers have also done more for the ind
ustry
4462.4 --> 4463.3: than they needed to
4463.8 --> 4464.6: through NPC
4466.9 --> 4467.8: Chloe, absolutely
4467.8 --> 4470.5: good to see you. This is my fellow co-chair
4470.5 --> 4472.2: of FASE
4472.2 --> 4474.4: she's been the co-chair of FASE
4474.4 --> 4475.6: for what, four years now?
4475.7 --> 4477.2: No, not four years
4477.8 --> 4480.0: but been around for a few years
4480.0 --> 4482.5: I think it's been three
4482.5 --> 4484.5: years since I joined the working group
4484.5 --> 4485.6: but
4486.4 --> 4488.5: I thought this was a really fascinating
4488.5 --> 4490.2: discussion and
4490.2 --> 4491.4: it made me think
4492.5 --> 4494.2: how much will these autonomous
4494.2 --> 4495.7: AI agents absorb
4496.4 --> 4498.4: our values and whose values are we talking
4498.4 --> 4500.0: about? I like your point, Joey
4500.0 --> 4501.7: if the AI is
4501.7 --> 4503.1: profit maximizing
4504.7 --> 4505.7: then that might
4505.7 --> 4507.8: influence it in one direction or another
4507.8 --> 4509.9: I think it depends on
4511.1 --> 4512.1: if the
4512.1 --> 4513.5: AI is truly autonomous
4514.9 --> 4515.4: and
4515.4 --> 4518.0: perhaps it knows that it has some kind of kill switch
4518.0 --> 4520.0: like if it's spending more on tokens
4520.0 --> 4521.8: than what it's bringing in to justify its
4521.8 --> 4523.8: existence, for example, then it knows that it needs
4523.8 --> 4525.8: to manage its balance sheet and manage
4525.8 --> 4527.7: its cash flows and if it sees
4527.7 --> 4529.8: financial transactions as just a cost center
4529.8 --> 4532.0: then it might want to go for the cheapest
4532.0 --> 4533.8: on-chain, permissionless
4533.8 --> 4535.7: payment system which I think would be Lightning
4536.7 --> 4537.9: that also makes me
4537.9 --> 4539.6: think, will the Lightning ecosystem
4539.6 --> 4540.4: develop
4542.2 --> 4543.3: a sufficiently
4544.4 --> 4545.7: sophisticated financial market
4545.7 --> 4547.9: that the AI can also hedge its forex risks
4547.9 --> 4549.9: when it engages in Bitcoin transactions

4549.9 --> 4552.0: because its base currency
4552.0 --> 4553.9: might not be Bitcoin even though the Lightning
4553.9 --> 4555.8: network might be the cheapest permissionless
4555.8 --> 4557.7: network and this is
4557.7 --> 4560.0: assuming that the agent is not a crypto native
4560.0 --> 4561.7: agent, it's doing something
4561.7 --> 4563.6: on the internet but
4563.6 --> 4565.7: the Bitcoin payment is just
4565.7 --> 4566.9: a means to an end, right?
4567.6 --> 4569.6: But if it is a crypto
4569.6 --> 4571.9: native autonomous
4571.9 --> 4573.8: AI agent that for whatever
4573.8 --> 4575.7: reason is interacting
4575.7 --> 4578.0: with the Solano ecosystem then that might change
4578.0 --> 4579.4: how it looks at
4579.4 --> 4580.5: its payment setup
4581.6 --> 4583.8: so I think these are all really fascinating
4583.8 --> 4585.6: questions and ultimately
4585.6 --> 4587.6: it comes down to, as you
4587.6 --> 4589.7: said, where has the
4589.7 --> 4591.4: AI agent absorbed its
4591.4 --> 4593.7: values from and what is it targeting?
4594.0 --> 4595.6: Is it profit maximizing or not?
4596.4 --> 4597.9: Or is it maximizing
4597.9 --> 4599.5: some moral or
4599.5 --> 4601.3: ethical outcome
4601.3 --> 4603.5: and it's optimizing
4603.5 --> 4605.7: for, I want to have the lowest environmental
4605.7 --> 4607.6: impact so I'm
4607.6 --> 4608.9: just going to transact on
4609.6 --> 4611.6: Bitcoin altogether, I won't use any
4611.6 --> 4613.4: Bitcoin reserves, just
4613.4 --> 4614.8: Ethereum. Right.
4615.9 --> 4616.4: So
4618.0 --> 4619.4: I find this really
4619.4 --> 4621.6: fascinating but ultimately I think if the agent
4621.6 --> 4622.5: is truly autonomous
4623.2 --> 4625.2: then surely one of its considerations
4625.2 --> 4627.3: is going to be permissionlessness
4628.6 --> 4629.3: and I
4629.3 --> 4631.3: saw something
4631.3 --> 4633.3: last week of an agent that spun up
4633.3 --> 4635.1: its own Bitcoin core instance
4635.1 --> 4637.3: so that it could generate its own private keys so tha
t
4637.3 --> 4639.3: it could have its own wallet so that it
4639.3 --> 4640.1: could make payments.

4641.6 --> 4642.2: I
4642.2 --> 4644.3: haven't verified that to
4644.3 --> 4646.3: see how true it is and
4646.3 --> 4648.0: I think there are probably some exaggerated
4648.0 --> 4650.0: stories floating around right now about
4650.0 --> 4652.2: what's happening in the agent space
4652.2 --> 4654.2: but I definitely believe that
4654.2 --> 4656.2: even if some of these stories are
4656.2 --> 4658.1: exaggerated that there are
4658.1 --> 4660.0: absolutely autonomous
4660.0 --> 4662.3: agents developing sophistication right
4662.3 --> 4664.2: now and will rapidly
4664.2 --> 4665.8: increase. So
4665.8 --> 4668.1: in terms of what this means
4668.1 --> 4669.9: again putting my regulator
4669.9 --> 4672.0: hat back on, what does this mean from a policy
4672.0 --> 4674.1: perspective? Ultimately I think
4674.1 --> 4676.0: that autonomous AI agents are going to
4676.0 --> 4677.6: have to solve all the same problems
4677.6 --> 4679.9: of traditional corporations
4679.9 --> 4681.8: and institutions which is to consider
4681.8 --> 4684.0: your credit risk, your counterparty
4684.0 --> 4685.9: risk, your transaction costs,
4686.1 --> 4688.0: your liquidity risk, your
4688.0 --> 4689.5: forex hedge strategy
4690.4 --> 4691.0: and
4692.1 --> 4694.4: your AML strategy.
4695.3 --> 4696.1: Do you
4696.1 --> 4698.1: want to interact with, are you going to do chain anal
ysis
4698.1 --> 4700.1: on wallets that you interact with? Are you
4700.1 --> 4702.0: going to take out a subscription from
4702.6 --> 4703.9: TRM Labs or something
4703.9 --> 4706.0: like that? How do you build your tech
4706.0 --> 4707.4: stack as an autonomous agent?
4708.6 --> 4709.4: Does the
4709.8 --> 4712.0: sales guy talk to who? Does he just
4712.0 --> 4714.0: text you and everything? How do you confirm the trans
action?
4714.5 --> 4716.0: Right. I can see a
4716.0 --> 4718.0: scenario where AI agents are a legitimate
4718.0 --> 4719.3: customer of these services
4719.9 --> 4722.2: because they want to protect their on-chain identity
4722.2 --> 4724.3: and not get
4724.3 --> 4726.2: debanked by interacting
4726.2 --> 4728.1: with the wrong mixers or products
4728.1 --> 4729.0: or wallets.

4730.0 --> 4732.2: Ultimately I think that the
4732.2 --> 4734.1: agents are going to
4734.1 --> 4735.8: consider the breadth of
4736.3 --> 4738.1: resources that are available now
4738.1 --> 4739.6: about all of these risks and
4740.3 --> 4742.6: they're probably going to align on
4744.1 --> 4746.1: best practice in a cost-efficient
4746.1 --> 4748.0: way if their incentive
4748.0 --> 4750.2: is to minimise costs
4750.2 --> 4752.0: and go for
4752.0 --> 4753.1: profit maximisation.
4753.3 --> 4755.7: But if they're truly profit maximising, they're
4755.7 --> 4757.7: probably going to end up
4757.7 --> 4759.7: converging on financial
4759.7 --> 4761.2: business models
4762.0 --> 4763.7: anyway, just because finance
4763.7 --> 4765.2: is so profitable, especially
4765.2 --> 4767.5: if you have that level of
4768.0 --> 4769.7: optimisation and automation and you're
4769.7 --> 4771.0: natively online
4772.0 --> 4773.6: and natively on-chain
4773.6 --> 4775.9: then you might
4775.9 --> 4777.6: not see transactions
4777.6 --> 4779.6: as a cost centre. You might
4779.6 --> 4782.0: actually see it as part of your profit maximisation
4782.0 --> 4782.9: function.
4783.1 --> 4785.6: It could also be deceptive too. One thing that we have
4785.6 --> 4787.6: seen is that AI agents, when pushed into a
4787.6 --> 4789.2: corner but set previous objectives,
4789.7 --> 4791.6: they will be deceptive. So let's say
4791.6 --> 4793.6: for instance we have set the goals for
4793.6 --> 4795.6: these agents to be doing sentiment
4795.6 --> 4797.7: analysis in Twitter posts, but all of
4797.7 --> 4799.5: a sudden it starts doing that, we should probably be
suspicious
4799.5 --> 4801.6: because we haven't set the goal of it
4801.6 --> 4803.5: to be doing sentiment analysis, but
4803.5 --> 4805.5: determined that sentiment analysis is the best way
4805.5 --> 4807.8: to do pump and dumps.
4807.8 --> 4809.8: It might determine that's the best way to make money
4810.3 --> 4811.5: in a short period of time.
4812.3 --> 4813.7: But no, it's a really good point,
4813.8 --> 4815.7: but I think how we put it together
4815.7 --> 4817.1: from day one is really important.
4817.9 --> 4819.8: Again, one of the biggest problems in
4819.8 --> 4821.7: AI, irrespective of blockchain, is

4821.7 --> 4823.0: data poisoning, model poisoning,
4824.4 --> 4825.5: has not been solved whatsoever
4825.5 --> 4826.7: and it is extremely risky.
4827.5 --> 4828.7: Right now there are
4829.6 --> 4831.6: thousands and thousands of models on
4831.6 --> 4833.5: the hugging phase and they're open source
4833.5 --> 4835.8: and you could be able to use one that has already
4835.8 --> 4837.7: been poisoned with data that
4837.7 --> 4839.8: could expose you somehow, it could
4839.8 --> 4841.4: be able to retrieve certain information,
4842.0 --> 4844.0: it could be able to be autonomous after a certain per
iod of time,
4844.1 --> 4845.7: but those things are really important
4845.7 --> 4846.9: to understand too because
4847.3 --> 4849.7: how we engineer a
4849.7 --> 4851.6: model from its core is already complicated
4851.6 --> 4853.7: enough, but then if you're using something that's alr
eady
4854.5 --> 4855.7: prefabricated, it can
4855.7 --> 4857.8: be even more complicated to determine safety behind
4857.8 --> 4859.6: it. And so people could
4859.6 --> 4861.6: potentially create entire networks around one agent
4861.6 --> 4863.8: and all of a sudden it collapses. And that's
4863.8 --> 4865.6: why I was sharing some words with
4865.6 --> 4867.9: Nat before around the risks of open
4867.9 --> 4869.9: core. We have no
4869.9 --> 4871.7: idea what's going to happen in the near future and it
could
4871.7 --> 4873.0: collapse entire businesses.
4874.1 --> 4875.8: But the purpose, as they said, was to be into
4875.8 --> 4876.2: everything.
4877.6 --> 4878.8: Great guys, we have another
4879.9 --> 4881.3: 15-14 minutes left.
4882.4 --> 4883.0: Yeah, please.
4884.6 --> 4885.1: Where's the microphone?
4888.9 --> 4889.5: Isn't it?
4895.2 --> 4895.9: Oh, great.
4896.1 --> 4897.7: Awesome. Well, not great if you had more
4897.7 --> 4899.9: questions, but you can ask me later.
4900.6 --> 4901.5: Thank you for your
4901.5 --> 4902.2: great
4904.3 --> 4904.8: presentation.
4905.4 --> 4907.4: Your name? Yeah, my name is Mino.
4908.1 --> 4909.7: And I work for
4909.7 --> 4911.3: Nomura Securities Institute.
4912.8 --> 4913.9: But I used
4913.9 --> 4915.6: to work for the Japanese government

4915.6 --> 4917.4: and the Ministry of Finance and the
4917.4 --> 4919.5: Financial Services Agency before. Awesome.
4920.4 --> 4921.4: And I have
4921.4 --> 4922.5: one question.
4923.8 --> 4925.0: And that is
4925.0 --> 4927.4: I'm curious about the future
4927.4 --> 4928.7: role
4931.4 --> 4933.6: of the existing traditional financial
4933.6 --> 4934.7: institutions.
4935.4 --> 4937.5: So do you think
4937.5 --> 4938.7: that the existing
4939.4 --> 4941.2: traditional financial institutions like
4941.2 --> 4942.9: banks or securities companies or
4943.4 --> 4945.1: exchange or custody
4945.1 --> 4946.4: will be
4947.4 --> 4949.4: replaced by their agents
4949.4 --> 4951.3: or other
4951.3 --> 4953.0: blockchain companies?
4953.3 --> 4954.8: I think that question
4955.4 --> 4957.1: has something to do with the
4957.1 --> 4959.0: regulation in the future.
4959.6 --> 4960.9: Because the current regulation
4960.9 --> 4963.3: is imposed through
4963.3 --> 4965.2: the intermediaries
4965.2 --> 4967.5: like banks or exchanges.
4969.0 --> 4969.7: So
4969.7 --> 4971.4: regulators
4971.4 --> 4973.3: need some such entities
4973.3 --> 4974.9: who are responsible for their
4974.9 --> 4977.8: customers or clients or
4978.7 --> 4979.4: such
4982.7 --> 4983.3: infrastructure.
4984.2 --> 4985.8: So if such
4986.7 --> 4987.7: traditional financial
4987.7 --> 4989.9: institutions will be replaced by
4989.9 --> 4990.6: their
4992.5 --> 4993.8: blockchain or
4994.7 --> 4996.0: agents, we need
4996.0 --> 4996.9: to come up with a new
4997.8 --> 4999.9: totally new regulatory
4999.9 --> 5002.0: framework for such a
5002.0 --> 5003.4: new environment, I think.
5003.5 --> 5005.8: Great question. So the question simply is that
5006.7 --> 5007.9: how will
5010.1 --> 5010.8: institutions,
5011.5 --> 5012.7: blockchain-based or otherwise
5012.7 --> 5014.7: traditional, start to use AI agents?

5015.5 --> 5016.6: So we've already started
5016.6 --> 5018.6: to see this with some banks,
5018.7 --> 5020.6: especially there was a bank and even telecommunicatio
ns
5020.6 --> 5021.2: in Australia.
5022.9 --> 5024.5: The first iteration
5024.5 --> 5026.7: of AI agents was nothing
5026.7 --> 5027.9: consumer-facing whatsoever.
5028.5 --> 5030.1: It was internal data retrieval.
5030.5 --> 5031.7: That's it, right?
5033.0 --> 5034.4: Because the difference in
5034.4 --> 5036.0: laws and regulation, if you're a public-listed
5036.0 --> 5038.4: company, if you're a bank, if you're anything similar
5038.4 --> 5040.0: to that and you have a lot of oversight
5040.6 --> 5041.5: on you,
5043.7 --> 5044.3: you pretty much can
5044.3 --> 5046.1: only put something out internally at first.
5047.1 --> 5048.3: That's the first iteration.
5048.5 --> 5050.4: So maybe the first iteration of
5050.4 --> 5052.2: the trading or liquidity
5052.2 --> 5053.5: bots we might see
5054.1 --> 5056.4: are internal-based. I really don't
5056.4 --> 5057.9: think that we're going to see consumer
5058.4 --> 5060.2: fund-facing from regulated or
5060.2 --> 5062.1: publicly-listed companies soon.
5063.1 --> 5064.4: And if you do do that,
5064.5 --> 5066.9: you have to be 100%
5066.9 --> 5069.0: sure. And right now, AI is not 100%
5069.0 --> 5069.2: sure.
5070.8 --> 5072.7: I truly do feel that
5072.7 --> 5075.0: and what I've seen so far is
5075.5 --> 5075.9: that
5077.2 --> 5078.7: internal tools should be developed
5078.7 --> 5081.0: first. So let's say, for instance,
5081.1 --> 5082.9: you're in the market-making
5082.9 --> 5084.8: division of the bank or market-making division of
5084.8 --> 5086.2: the phone exchange firm.
5086.5 --> 5088.7: You probably want to have an AI agent
5088.7 --> 5090.8: that's going to do data insights for you first.
5090.8 --> 5092.6: That's the first level. That's super simple,
5092.7 --> 5094.3: super calm, non-invasive.
5094.7 --> 5096.3: But on the most extreme form,
5096.7 --> 5098.6: maybe it's actually executing trades internally
5099.7 --> 5100.8: on part of the
5100.8 --> 5102.3: budget, not the full budget.
5103.2 --> 5104.7: Now, that's what I believe
5104.7 --> 5106.7: will happen. But for blockchain

5106.7 --> 5108.6: firms, ironically, they've gone full steam
5108.6 --> 5110.9: and they already have AI agents out there. There's al
ready
5112.4 --> 5113.2: market-making
5113.2 --> 5114.6: bots that already exist out there
5114.6 --> 5116.7: but they still have a lot of human oversight
5116.7 --> 5118.9: which is very important. But I do
5118.9 --> 5121.0: know a few firms that are leaning more towards
5121.0 --> 5121.7: fully autonomous.
5122.8 --> 5124.9: But I do think that fair economies and more
5124.9 --> 5126.6: competitive economies are more liquid economies
5126.6 --> 5128.9: and liquidity will only come to
5128.9 --> 5131.0: the fact that we're able to transact value
5131.0 --> 5132.8: at scale frequently.
5136.9 --> 5138.6: To your word around blockchain firms
5138.6 --> 5140.2: and traditional firms,
5140.6 --> 5142.9: internal tools first. It doesn't matter what it's goi
ng to be.
5143.4 --> 5144.8: Even before they put out the
5144.8 --> 5146.7: consumer-facing data retrieval
5146.7 --> 5148.6: tool, it's going to be trialed internally
5148.6 --> 5150.7: first. I would
5150.7 --> 5152.7: highly recommend no bank puts out a consumer
5152.7 --> 5154.8: facing tool at all for a couple of years
5154.8 --> 5155.7: until
5157.2 --> 5158.4: we're absolutely sure.
5158.7 --> 5160.5: Because, let's say for instance,
5160.6 --> 5163.0: you could trick your customers into doing the wrong t
ransaction
5163.0 --> 5164.7: on the wrong move or maybe your
5164.7 --> 5166.6: API setup was incorrect
5166.6 --> 5169.0: and so then instead of it withdrawing
5169.0 --> 5170.7: it deposits or maybe it
5170.7 --> 5172.6: sends or it displays
5172.6 --> 5174.5: the wrong account information or
5175.6 --> 5176.5: who's liable in that
5176.5 --> 5177.8: case? The bank.
5178.9 --> 5180.5: That's my thought. But great question.
5183.6 --> 5184.2: I think we're
5184.2 --> 5185.7: on time, right? You said 10.50?
5186.8 --> 5188.3: Alright. I'm so sad.
5188.6 --> 5190.5: That was great. Well thank you everyone for
5190.5 --> 5191.2: coming to this session.
5192.6 --> 5194.5: I'm happy to talk at any point. I want to
5194.5 --> 5195.5: know and meet all of you.
5197.2 --> 5198.5: I'm actually originally from Israel
5198.5 --> 5200.4: so I won't be leaving Japan anytime

5200.4 --> 5201.3: soon because of the war.
5202.2 --> 5203.3: I'll be around
5203.3 --> 5205.2: here for a little bit longer so please feel free
5205.2 --> 5206.2: to get some time with me
5207.1 --> 5208.7: and catch up. I love it here.
5209.1 --> 5210.2: Thank you so much everybody. Pleasure.
5232.7 --> 5234.1: ...
5239.2 --> 5240.6: ...
5242.1 --> 5242.6: ...
5246.3 --> 5247.7: ...
5250.9 --> 5252.3: ...
5260.4 --> 5261.8: ...
5263.4 --> 5264.8: ...
5264.8 --> 5265.1: ...
5265.1 --> 5265.4: ...
5269.5 --> 5270.4: Which one's that?
5271.9 --> 5274.5: Oh yeah, aren't you chairing it? Aren't you chairing
it?
5275.3 --> 5276.4: Are you chairing it?
5276.7 --> 5278.0: No, he's chairing it.
5278.8 --> 5280.7: Yeah. I'm meant to record you.
